The kvsetkeys package

Heiko Oberdiek <oberdiek@uni-freiburg.de>

2009/07/30 v1.5

Abstract

Package kvsetkeys provides \kvsetkeys, a variant of package keyval's \setkeys. It allows to specify a handler that deals with unknown options. Active commas and equal signs may be used (e.g. see babel's shorthands) and only one level of curly braces is removed from the values.

1 Documentation

First I want to recommend the very good review article "A guide to key-value methods" by Joseph Wright [1]. It introduces the different key-value packages and compares them.

1.1 Motivation

\kvsetkeys serves as replacement for keyval's \setkeys. It basically uses the same syntax. But the implementation is more robust and predictable:

Active syntax characters: Comma ',' and the equals sign '=' are used inside key value lists as syntax characters. Package keyval uses the catcode of the characters that is active during package loading, usually this is catcode 12 (other). But it can happen that the catcode setting of the syntax characters changes. Especially active characters are of interest, because some language adaptations uses them. For example, option turkish of package babel uses the equals sign as active shorthand character. Therefore package kvsetkeys deals with both catcode settings 12 (other) and 13 (active).

Brace removal: Package keyval's \setkeys removes up to two levels of curly braces around the value in some unpredictable way:

This package kvsetkeys follows a much stronger rule: Exactly one level of braces are removed from an item, if the item is surrounded by curly braces. An item can be a the key value pair, the key or the value.

Arbitrary values: Unmatched conditionals are supported.

Before I describe \kvsetkeys in more detail, first I want to explain, how this package deals with key value lists. For the package also provides low level interfaces that can be used by package authors.

1.2 Normalizing key value lists

```
\verb|\kv@normalize| \{\langle key \ value \ list \rangle\}|
```

If the user specifies key value lists, he usually prefers nice formatted source code, e.g.:

```
hypersetup{
  pdftitle = {...},
  pdfsubject = {...},
  pdfauthor = {...},
  pdfkeywords = {...},
  ...
}
```

Thus there can be spaces around keys, around = or around the value. Also empty entries are possible by too many commas. Therefore these spaces and empty entries are silently removed by package keyval and this package. Whereas the contents of the value can be protected by curly braces, especially if spaces or commas are used inside, a key name must not use spaces or other syntax characters.

\kv@normalize takes a key value list and performs the cleanup:

- Spaces are removed.
- Syntax characters (comma and equal sign) that are active are replaced by the same characters with standard catcode. (Example: babel's language option turkish uses the equal sign as active shorthand character.)

The result is stored in \kv@list, e.g.:

```
\kv@list \rightarrow ,pdftitle={\\...},pdfsubject={\\...},\\...,
```

Curly braces around values (or keys) remain untouched.

- v1.3+: One comma is added in front of the list and each pair ends with a comma. Thus an empty list consists of one comma, otherwise two commas encloses the list. Empty entries other than the first are removed.
- v1.0 v1.2: Empty entries are removed later. In fact it adds a comma at the begin and end to protect the last value and an easier implementation.

1.3 Parsing key value lists

```
\kv@parse \{\langle key\ value\ list\rangle\} \{\langle processor\rangle\}
```

It is easier to parse a normalized list, thus \kv@parse normalizes the list and calls \kv@parse@normalized.

```
\kv@parse@normalized \{\langle key\ value\ list \rangle\}\ \{\langle processor \rangle\}
```

Now the key value list is split into single key value pairs. For further processing the key and value are given as arguments for the $\langle processor \rangle$:

```
\langle processor \rangle \{\langle key \rangle\} \{\langle value \rangle\}
```

Also key and value are stored in macro names:

- \kv@key stores the key.
- \kv@value stores the value or if the value was not specified it has the meaning \relax.

The behaviour in pseudo code:

1.4 Processing key value pairs

```
\verb|\kv@processor@default{$\langle family\rangle$} {\langle key\rangle$} {\langle value\rangle$}
```

There are many possibilities to process key value pairs. \kv@processor@default is the processor used in \kvsetkeys. It reimplements and extends the behaviour of keyval's \setkeys. In case of unknown keys \setkeys raise an error. This processer, however, calls a handler instead, if it is provided by the family.

The behaviour in pseudo code:

```
if \langle key \rangle exists call the keyval code of \langle key \rangle else if \langle handler \rangle for \langle family \rangle exists \langle handler \rangle \{\langle key \rangle\} \{\langle value \rangle\} else raise unknown key error fi
```

1.5 Default family handler

\kv@processor@default calls \langle handler \rangle, the default handler for the family, if the key does not exist in the family. The handler is called with two arguments, the key and the value. It can be defined with \kv@set@family@hander:

```
\verb|\kv@set@family@handler| {$\langle family \rangle$} { \langle handler \ definition \rangle$}
```

This sets the default family handler for the keyval family $\langle family \rangle$. Inside $\langle handler definition \rangle$ #1 stands for the key and #2 is the value. Also \kv@key and \kv@value can be used for the key and the value. If the value is not given, \kv@value has the meaning \relax.

1.6 Put it all together

```
\kvsetkeys \{\langle family \rangle\} \{\langle key\ value\ list \rangle\}
```

The work is done by the previous commands. \kvsetkeys just calls them:

Thus you can replace \setkeys of package keyval by the key value parser of this package:

```
\renewcommand*{\setkeys}{\kvsetkeys}
or
\let\setkeys\kvsetkeys
```

1.7 Comma separated lists

Since version 2007/09/29 v1.3 this package also supports the normalizing and parsing of general comma separated lists.

```
\comma@normalize\{\langle comma\ list
angle\}
```

Macro \comma@normalize normalizes the comma separated list, removes spaces around commas. The result is put in macro \comma@list.

```
\comma@parse{\langle comma \ list \rangle} {\langle processor \rangle}
```

Macro \comma@parse first normalizes the comma separated list and then parses the list by calling \comma@parse@normalized.

```
\verb|\comma@parse@normalized| \{\langle normalized \ comma \ list \rangle\} \{\langle processor \rangle\}|
```

The list is parsed. Empty entries are ignored. $\langle processor \rangle$ is called for each non-empty entry with the entry as argument:

```
\langle processor \rangle \{\langle entry \rangle \}
```

Also the entry is stored in the macro \comma@entry.

2 Example

The following example prints a short piece of HTML code using the tabbing environment for indenting purpose and a key value syntax for specifying the attributes of an HTML tag. The example illustrates the use of a default family handler.

```
1 (*example)
 2 \documentclass{article}
 3 \usepackage[T1]{fontenc}
 4 \usepackage{kvsetkeys}
 5 \usepackage{keyval}
7 \makeatletter
 8 \newcommand*{\tag}[2][]{%
    % #1: attributes
9
    % #2: tag name
10
11
    \begingroup
12
      \toks@={}%
13
      \let\@endslash\@empty
      \kvsetkeys{tag}{#1}%
14
15
      \texttt{%
         \textless #2\the\toks@\@endslash\textgreater
16
17
      }%
18
    \endgroup
19 }
20 \kv@set@family@handler{tag}{%
    % #1: key
21
    % #2: value
22
23
    \toks@\expandafter{%
^{24}
      \the\toks@
25
      \space
26
      #1=\string"#2\string"%
27
    }%
28 }
29 \define@key{tag}{/}[]{%
    \def\@endslash{/}%
30
31 }
32 \makeatother
33
34 \begin{document}
35 \begin{tabbing}

5 Installation

5.1 Download

Package. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/kvsetkeys.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/kvsetkeys.pdf Documentation.

Bundle. All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

5.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

5.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain- T_EX :

```
tex kvsetkeys.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

¹ftp://ftp.ctan.org/tex-archive/

5.4 Refresh file name databases

If your TEX distribution (teTEX, mikTEX, ...) relies on file name databases, you must refresh these. For example, teTEX users run texhash or mktexlsr.

5.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the .dtx source file. It can be extracted by AcrobatReader 6 or higher. Another option is pdftk, e.g. unpack the file into the current directory:

```
pdftk kvsetkeys.pdf unpack_files output .
```

Unpacking with LATEX. The .dtx chooses its action depending on the format:

plain-T_EX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using LATEX for docstrip (really, docstrip does not need LATEX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{kvsetkeys.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfLATEX:

```
pdflatex kvsetkeys.dtx
makeindex -s gind.ist kvsetkeys.idx
pdflatex kvsetkeys.dtx
makeindex -s gind.ist kvsetkeys.idx
pdflatex kvsetkeys.dtx
```

6 References

7 History

[2006/03/06 v1.0]

• First version.

[2006/10/19 v1.1]

- Fix of \kv@set@family@handler.
- Example added.

[2007/09/09 v1.2]

- Using package infwarerr for error messages.
- Catcode section rewritten.

[2007/09/29 v1.3]

- Normalizing and parsing of comma separated lists added.
- \kv@normalize rewritten.
- Robustness increased for normalizing and parsing, e.g. for values with unmatched conditionals.
- ε -T_EX is used if available.
- Tests added for normalizing and parsing.

[2009/07/19 v1.4]

• Bug fix for \kv@normalize: unwanted space removed (Florent Chervet).

[2009/07/30 v1.5]

• Documentation addition: recommendation for Joseph Wright's review article.

8 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
