The zref package

Heiko Oberdiek <oberdiek@uni-freiburg.de>

2009/08/07 v2.4

Abstract

Package zref tries to get rid of the restriction in LATEX's reference system that only two properties are supported. The package implements an extensible referencing system, where properties are handled in a more flexible way. It offers an interface for macro programmers for the access to the system and some applications that uses the new reference scheme.

1 Introduction

11 Index

Standard LATEX's reference system with \label, \ref, and \pageref supports two properties, the appearance of the counter that is last incremented by \refstepcounter and the page with the \label command.

Unhappily LATEX does not provide an interface for adding another properties. Packages such as hyperref, nameref, or titleref are forced to use ugly hacks to extend the reference system. These ugly hacks are one of the causes for hyperref's difficulty regarding compatibility with other packages.

1.1 Standard LATEX behaviour

References are created by the \label command:

```
\chapter{Second chapter}
\section{First section on page 7} % section 2.1
\label{myref}
```

Now LATEX records the section number 2.1 and the page 7 in the reference. Internally the reference is a list with two entries:

```
r0myref \rightarrow \{2.1\}\{7\}
```

The length of the list if fixed in the LATEX kernel, An interface for adding new properties is missing.

There are several tries to add new properties:

hyperref uses a list of five properties instead of the standard list with two entries. This causes many compatibility problems with LATEX and other packages.

titleref stores its title data into the first entry in the list. IATEX is happy because it does only see its list with two entries. The situation becomes more difficult, if more properties are added this way. Then the macros form a nested structure inside the first reference argument for the label. Expandable extractions will then become painful.

1.2 Basic idea

Some time ago Morten Høgholm sent me an experimental cross referencing mechanism as "expl3" code. His idea is:

```
\label_plist \rightarrow \\ \xref_dance_key{salsa}\xref_name_key{Morten}...
```

The entries have the following format:

```
\xref_{\your\ key}_{\key}{\xref_{\your\ kext}}
```

This approach is much more flexible:

- New properties can easily be added, just use a new key.
- The length of the list is not fixed. A reference can use a subset of the keys.
- The order of the entries does not matter.

Unhappily I am not familiar with the experimental code for LATEX3 that will need some time before its first release. Thus I have implemented it as LATEX 2_{ε} package without disturbing the existing LATEX reference system.

1.3 Interfaces

The package provides a generic *interface for programmers*. Commands of this interface are prefixed by \zref@.

Option user enabels the *user interface*. Here the commands are prefixed by \z to avoid name clashes with existing macros.

Then the packages provides some *modules*. They are applications for the reference system and can also be considered as examples how to use the reference system.

The modules can be loaded as packages. The package name is prefixed with <code>zref-</code>, for example:

```
\RequirePackage{zref-abspage}
```

This is the preferred way if the package is loaded from within other packages to avoid option clashes.

As alternative package zref can be used and the modules are given as options:

\usepackage[perpage,user]{zref}

2 Interface for programmers

The user interface is described in the next section 3.

2.1 Entities

Reference. Internally a reference is a list of key value pairs:

```
\ZOROmyref \rightarrow \default\{2.1\} \page\{7\}
```

The generic format of a entry is:

```
\ZQRQ(refname) \rightarrow \(propname) \{(value)\}
```

 $\langle refname \rangle$ is the name that denoted references (the name used in \label and \ref). $\langle propname \rangle$ is the name of the property or key. The property key macro is never executed, it is used in parameter text matching only.

Property. Because the name of a property is used in a macro name that must survive the .aux file, the name is restricted to letters and '@'.

Property list. Often references are used for special purposes. Thus it saves memory if just the properties are used in this reference that are necessary for its purpose.

Therefore this package uses the concept of *property lists*. A property list is a set of properties. The set of properties that is used by the default \label command is the *main property list*.

2.2 Property list

exp means that the implementation of the marked macro is expandable.

```
\zref@newlist \{\langle \mathit{listname} \rangle\}
```

Declares a new empty property list.

Adds the property $\langle propname \rangle$ to the property list $\langle listname \rangle$. The property and list must exist.

```
\zref@localaddprop \{\langle listname \rangle\} \{\langle propname \rangle\}
```

Local variant of \zref@addprop.

```
\zref@listexists \{\langle listname \rangle\}\ \{\langle then \rangle\}
```

Executes $\langle then \rangle$ if the property list $\langle listname \rangle$ exists or raise an error otherwise.

```
\zref@iflistundefined^{exp} {\langle listname \rangle} {\langle then \rangle} {\langle else \rangle}
```

Executes $\langle then \rangle$ if the list exists or $\langle else \rangle$ otherwise.

```
\cline{Containsprop} \{\langle listname \rangle\} \{\langle propname \rangle\} \{\langle then \rangle\} \{\langle else \rangle\}
```

Executes $\langle then \rangle$ if the property $\langle propname \rangle$ is part of property list $\langle listname \rangle$ or otherwise it runs the $\langle else \rangle$ part.

2.3 Property

```
\zref@newprop* {\langle propname \rangle} [\langle default \rangle] {\langle value \rangle}
```

This command declares and configures a new property with name $\langle propname \rangle$.

In case of unknown references or the property does not exist in the reference, the $\langle default \rangle$ is used as value. If it is not specified here, a global default is used, see $\zref@setdefault$.

The correct values of some properties are not known immediately but at page shipout time. Prominent example is the page number. These properties are declared with the star form of the command.

```
\zref@setcurrent {\langle propname \rangle} {\langle value \rangle}
```

This sets the current value of the property $\langle propname \rangle$. It is a generalization of setting LATEX's \currentlabel.

```
\zref@getcurrent {\langle propname \rangle} {\langle value \rangle}
```

This returns the current value of the property $\langle propname \rangle$. The value may not be correct, especially if the property is bound to a page (start form of \zref@newprop) and the right value is only known at shipout time (e.g. property 'page').

```
\zref@propexists \{\langle propname \rangle\} \{\langle then \rangle\}
```

Calls $\langle then \rangle$ if the property $\langle propname \rangle$ is available or generates an error message otherwise.

```
\verb|\zref@ifpropundefined| exp| \{\langle propname \rangle\} | \{\langle then \rangle\} | \{\langle else \rangle\}|
```

Calls $\langle then \rangle$ or $\langle else \rangle$ depending on the existence of property $\langle propname \rangle$.

2.4 Reference generation

```
\zref@label {\langle refname \rangle}
```

This works similar to **\label**. The reference $\langle refname \rangle$ is created and put into the .aux file with the properties of the main property list.

```
\zref@labelbylist \{\langle refname \rangle\} \{\langle listname \rangle\}
```

Same as $\zref@label$ except that the properties are taken from the specified property list $\langle listname \rangle$.

```
\zref@labelbyprops \{\langle refname \rangle\} \{\langle propnameA \rangle, \langle propnameB \rangle, \ldots \}
```

Same as \zref@label except that these properties are used that are given as comma separated list in the second argument.

```
\zref@newlabel {\langle refname \rangle} {...}
```

This is the macro that is used in the .aux file. It is basically the same as \newlabel apart from the format of the data in the second argument.

2.5 Data extraction

This is the basic command that references the value of a property $\langle propname \rangle$ for the reference $\langle refname \rangle$. In case of errors such as undefined reference the $\langle default \rangle$ is used instead.

The command is an abbreviation for \zref@extractdefault. As default the default of the property is taken, otherwise the global default.

Example for page references:

```
IPTEX: \pageref{foobar}
zref: \zref@extract{foobar}{page}
```

Both \zref@extract and \zref@extractdefault are expandable. That means, these macros can directly be used in expandable calculations, see the example file. On the other side, babel's shorthands are not supported, there are no warnings in case of undefined references.

If an user interface doesn't need expandable macros then it can use \zref@refused and \zref@wrapper@babel for its user macros.

This command is not expandable. It causes the warnings if the reference $\langle refname \rangle$ is not defined. Use the \zref@extract commands inside expandable contexts and mark their use outside by \zref@refused, see the example file.

\zref@ifrefundefined
$$^{\exp} \{\langle refname \rangle\} \{\langle then \rangle\} \{\langle else \rangle\}$$

A possibility to check whether a reference exists.

Test whether a reference provides a property.

2.6 Setup

\zref@default

Holds the global default for unknown values.

$\zref@setdefault {\langle value \rangle}$

Sets the global default for unknown values. The global default is used, if a property does not specify an own default and the value for a property cannot be extracted. This can happen if the reference is unknown or the reference does not have the property.

$\zref@setmainlist {\langle value \rangle}$

Sets the name of the main property list. The package sets and uses main.

2.7 Declared properties

Module	Property	Property list	Default
	default	main	< emp $ty>$
	page	main	< emp $ty>$
abspage, totpages	abspage	main	0
perpage	pagevalue	perpage	0
	page	perpage	< emp $ty>$
	abspage	perpage	0
counter	counter	main	< emp $ty>$
titleref	title	main	< emp $ty>$
savepos	posx	savepos	0
	posy	savepos	0
hyperref	anchor	main	< emp $ty>$
	url		< emp $ty>$
xr	url		< emp $ty>$

2.8 Wrapper for advanced situations

$\zref@wrapper@babel {...} {\langle name \rangle}$

This macro helps to add shorthand support. The second argument is protected, then the code of the first argument is called with the protected name appended.

Examples are in the sources.

\zref@wrapper@immediate {...}

There are situations where a label must be written instantly to the .aux file, for example after the last page. If the \zlabel or \label command is put inside this wrapper, immediate writing is enabled. See the implementation for module lastpage for an example of its use.

\zref@wrapper@unexpanded {...}

Assuming someone wants to extract a value for property bar and store the result in a macro \foo without traces of the expanding macros and without expanding the value. This (theoretical?) problem can be solved by this wrapper:

```
\edef\foo{%
  \zref@wrapper@unexpanded{%
   \zref@extract{someref}{bar}%
  }%
}
```

The \edef forces the expansion of \zref@extract, but the extraction of the value is prevented by the wrapper that uses ε -TEX' \unexpanded for this purpose.

2.9 Counter for unique names

Some modules (titleref and dotfillmin) need unique names for automatically generated label names.

\zref@require@unique

This command creates the unique counter **zref@unique** if the counter does not already exist.

\thezref@unique

This command is used to generate unique label names.

3 User interface

3.1 Module user

The user interface for this package and its modules is enabled by zref's package option user or package zref-user. The names of user commands are prefixed by z in order to avoid name clashes with existing macros of the same functionality. Thus the package does not disturb the traditional reference scheme, both can be used together.

The syntax descriptions contain the following markers that are intended as hints for programmers:

```
babel Babel shorthands are allowed. robust Robust macro.
```

exp Expandable version:

- robust, unless the extracted values are fragile,
- no babel shorthand suport.

The basic user interface of the package without modules are commands that mimic the standard LATEX behaviour of \label, \ref, and \pageref:

Similar to **\label**. It generates a label with name $\langle refname \rangle$ in the new reference scheme

Without optional argument similar to \ref, it returns the default reference property. This property is named default:

$$\zref\{x\} \equiv \zref[default]\{x\}$$

Convenience macro, similar to \pageref.

$$\zpageref{x} \equiv \zref[page]{x}$$

```
\zrefused \{\langle \mathit{refname} \rangle\}^{\mathrm{babel}}
```

Some of the user commands in the modules are expandable. The use of such commands do not cause any undefined reference warnings, because inside of expandable contexts this is not possible. However, if there is a place outside of expandable contexts, \refused is strongly recommended. The reference \(\lambda refname \rangle \) is marked as used, undefined ones will generate warnings.

3.2 Module abspage

With the help of package atbegshi a new counter abspage with absolute page numbers is provided. Also a new property abspage is defined and added to the main property list. Thus you can reference the absolute page number:

```
Section \zref{foo} is on page \zpageref{foo}.

This is page \zref[abspage]{foo} of \zref[abspage]{LastPage}.
```

The example also makes use of module lastpage.

3.3 Module lastpage

Provides the functionality of package lastpage [3] in the new reference scheme. The label LastPage is put at the end of the document. You can refer the last page number with:

```
\zpageref{LastPage}
```

Since version 2008/10/01 v2.3 the module defines the list LastPage. In addition to the properties of the main list label LastPage also stores the properties of this list LastPage. The default of this list is empty. The list can be used by the user to add additional properties for label LastPage.

3.3.1 Example

- $1 \langle *example lastpage \rangle$
- 2 \NeedsTeXFormat{LaTeX2e}
- 3 \documentclass{report}
- 4 %

```
5 \newcounter{foo}
 6 \renewcommand*{\thefoo}{\Alph{foo}}
8 \usepackage{zref-lastpage,zref-user}[2008/10/01]
10 \makeatletter
11 \zref@newprop{thefoo}{\thefoo}
12 \zref@newprop{valuefoo}{\the\value{foo}}
13 \zref@newprop{chapter}{\thechapter}
14 \zref@addprop{LastPage}{thefoo}
15 \zref@addprop{LastPage}{valuefoo}
16 \zref@addprop{LastPage}{chapter}
17 \makeatother
18 %
19 \newcommand*{\foo}{%
    \stepcounter{foo}%
^{21}
    [Current foo: \thefoo]%
22 }
23 %
24 \begin{document}
25
    \chapter{First chapter}%
    Last page is \zref{LastPage}.\\%
26
27
    Last chapter is \zref[chapter]{LastPage}.\\%
28
    Last foo is \zref[thefoo]{LastPage}.\\%
    Last value of foo is \zref[valuefoo]{LastPage}.\\%
29
    \foo
30
31
    \chapter{Second chapter}%
32
    \foo\foo\foo
33
    \chapter{Last chapter}%
34
    \foo
35 \end{document}
36 ⟨/example — lastpage⟩
```

3.4 Module totpages

For the total number of pages of a document you need to know the absolute page number of the last page. Both modules abspage and lastpage are necessary and automatically enabled.

```
\ztotpages<sup>exp</sup>
```

Prints the total number of pages or 0 if this number is not yet known. It expands to an explicit number and can also used even in expandable calculations (\numexpr) or counter assignments.

3.5 Module runs

Module runs counts the LATEX runs since last .aux file creation and prints the number in the .log file.

 \zruns^{exp}

Prints the total number of LATEX runs including the current one. It expands to an explicit number. Before begin{document} the value is zero meaning the .aux file is not read yet. If a previous .aux file exists, the value found there increased by one is the new number. Otherwise \zruns is set to one. LATEX runs where the .aux files are not rewritten are not counted (see \nofiles).

3.6 Module perpage

With \@addtoreset or \numberwithin a counter can be reset if another counter is incremented. This do not work well if the other counter is the page counter. The page counter is incremented in the output routine that is often called asynchronous somewhere on the next page. A reference mechanism costs at least two IATEX runs, but ensures correct page counter values.

```
\zmakeperpage [\langle reset \rangle] \{\langle counter \rangle\}
```

At the of a new page counter $\langle counter \rangle$ starts counting with value $\langle reset \rangle$ (default is 1). The macro has the same syntax and semantics as \MakePerPage of package perpage [5]. Also perpage of package footmisc [1] can easily be simulated by

```
\zmakeperpage{footnote} % \usepackage[perpage]{footmisc}
```

If footnote symbols are used, some people dislike the first symbol †. It can easily be skipped:

\zmakeperpage[2]{footnote}

```
\thezpage counter zpage
```

If the formatted counter value of the counter that is reset at a new page contains the page value, then you can use \thezpage, the page number of the current page. Or counter zpage can be used, if the page number should be formatted differently from the current page number. Example:

```
\newcounter{foobar}
\zmakeperpage{foobar}
\renewcommand*{\thefoobar}{\thezpage-\arabic{foobar}}
% or
\renewcommand*{\thefoobar}{\roman{zpage}-\arabic{foobar}}}
```

The reset mechanism for this counter is deactivated.

3.7 Module counter

This option just add the property counter to the main property list. The property stores the counter name, that was responsible for the reference. This is the property hyperref's \autoref feature uses. Thus this property counter may be useful for a reimplementation of the autoref feature, see the section 4 with the todo list.

3.8 Module titleref

This option makes section and caption titles available to the reference system similar to packages titleref or nameref.

```
\ztitleref \{\langle \mathit{refname} \rangle\}^{\mathrm{babel}}
```

Print the section or caption title of reference $\langle refname \rangle$, similar to \nameref or \titleref.

```
\ztitlerefsetup {key_1=value_1, key_2=value_2, \ldots}
```

This command allows to configure the behaviour of module titleref. The following keys are available:

```
title=\langle value \rangle
```

Sets the current title.

stripperiod=true|false

Follow package nameref that removes a last period. Default: true.

expand=true|false

Package \titleref expands the title first. This way garbage and dangerous commands can be removed, e.g. \label, \index.... See implementation section for more details. Default is false.

```
\texttt{cleanup=}\{\dots\}
```

Hook to add own cleanup code, if method expand is used. See implementation section for more details.

3.9 Module savepos

This option supports a feature that pdfTEX provides (and XeTEX). pdfTEX is able to tell the current position on the page. The page position is not instantly known. First the page must be constructed by TEX's asynchronous output routine. Thus the time where the position is known is the page shipout time. Thus a reference system where the information is recorded in the first run and made available for use in the second run comes in handy.

```
\zsavepos \{\langle refname \rangle\}
```

It generates a reference with name $\langle refname \rangle$ to the location where the command is executed.

```
\zposx^{exp} \{\langle refname \rangle\}\ \zposy^{exp} \{\langle refname \rangle\}\
```

Get the position as number. Unit is sp. Horizontal positions by \zposx increase from left to right. Vertical positions by \zposy from bottom to top.

Do not rely on absolute page numbers. Because of problems with the origin the numbers may differ in DVI or PDF mode of pdfTEX. Therefore work with relative values by comparisons.

Both \zposx and \zposy are expandable and can be used inside calculations (\setcounter, \addtocounter, package calc, \numexpr). However this property prevents from notifying LATEX that the reference is actually used (the notifying is not expandable). Therefore you should mark the reference as used by \zrefused.

This module uses pdfTeX's \pdfsavepos, \pdflastxpos, and \pdflastypos. They are available in PDF mode and since version 1.40.0 also in DVI mode.

3.10 Module dotfill

\zdotfill

This package provides the command \zdotfill that works similar to \dotfill, but can be configured. Especially it suppresses the dots if a minimum number of dots cannot be set.

```
\zdotfillsetup \{key_1 = value_1, key_2 = value_2, \ldots\}
```

This command allows to configure the behaviour of **\zdotfill**. The following keys are available:

 $min=\langle count \ value \rangle$

If the actual number of dots are smaller than $\langle count \ value \rangle$, then the dots are suppressed. Default: 2.

 $unit=\langle dimen\ value \rangle$

The width of a dot unit is given by $\langle dimen\ value \rangle$. Default: 0.44em (same as the unit in $\backslash dotfill$).

 $dot=\langle value \rangle$

The dot itself is given by $\langle value \rangle$. Default: . (dot, same as the dot in \dotfill).

3.11 Module xr

This package provides the functionality of package xr, see [8]. It also supports the syntax of xr-hyper.

```
\zexternaldocument * [\langle prefix \rangle]^{babel} \{\langle external\ document \rangle\} [\langle url \rangle]
```

See \externaldocument for a description of this option. The standard reference scheme and the scheme of this package use different name spaces for reference names. If the external document uses both systems. Then one import statement would put the names in one namespace and probably causing problems with multiple references of the same name. Thus the star form only looks for \newlabel in the .aux files, whereas without star only \zref@newlabels are used.

In the star form it tries to detect labels from hyperref, titleref, and ntheorem. If such an extended property from the packages before cannot be found or are empty, they are not included in the imported reference.

Warnings are given if a reference name is already in use and the item is ignored. Unknown properties will automatically be declared.

If the external references contain **anchor** properties, then we need also a url to be able to address the external file. As default the filename is taken with a default extension.

```
\zxrsetup \{key_1 = value_1, key_2 = value_2, \ldots\}
```

Currently the key ext is defined, this sets the url default extension.

\zref@xr@ext

If the $\langle url \rangle$ is not specified in $\zref@externaldocument$, then the url will be constructed with the file name and this macro as extension. $\xref@ext$ is used if hyperref is loaded, otherwise pdf.

4 ToDo

Among other things the following issues are left for future work:

- The user land macros are not checked for robustness yet. They can be fragile. If this happens, use \protect until a later version of this package. The \protect will not disturb, if the protected macro become robust in the future
- Other applications: autoref, hyperref, ...

5 Example

Chapters are wrapped inside \ChapterStart and \ChapterStop. The first argument #1 of \ChapterStart is used to form a label id chap:#1. At the end of the chapter another label is set by \zref@wrapper@immediate, because otherwise at the end of document a deferred write would not be written, because there is no page for shipout.

Also this example shows how chapter titles can be recorded. A new property chaptitle is declared and added to the main property list. In \ChapterStart the current value of the property is updated.

```
44 \makeatletter
45 \zref@newprop{chaptitle}{}
46 \zref@addprop{main}{chaptitle}
48 \newcommand*{\ChapterStart}[2]{%
49
    \cleardoublepage
    \def\current@chapid{#1}%
50
51
    \zref@setcurrent{chaptitle}{#2}%
    \chapter{#2}%
53
    \zlabel{chap:#1}%
54 }
55 \newcommand*{\ChapterStop}{%
56
    \cleardoublepage
    \zref@wrapper@immediate{%
57
       \zref@labelbyprops{chapend:\current@chapid}{abspage}%
58
59
60 }

6 Implementation

6.1 Package zref

6.1.1 Identification

```
155 (*package)
156 \NeedsTeXFormat{LaTeX2e}
157 \ProvidesPackage{zref}
158 [2009/08/07 v2.4 New reference scheme for LaTeX2e (HO)]%
```

6.1.2 Load basic module

159 \RequirePackage{zref-base} [2009/08/07]

Abort package loading if zref-base could not be loaded successfully. 160 \@ifundefined{ZREF@baseok}{\endinput}{}

6.1.3 Process options

Known modules are loaded and the release date is checked.

```
161 \def\ZREF@temp#1{%
     \DeclareOption{#1}{%
162
       \AtEndOfPackage{%
163
         \RequirePackage{zref-#1}[2009/08/07]%
164
165
       }%
    }%
166
168 \ZREF@temp{abspage}
169 \ZREF@temp{counter}
170 \ZREF@temp{dotfill}
171 \ZREF@temp{hyperref}
172 \ZREF@temp{lastpage}
173 \ZREF@temp{perpage}
174 \ZREF@temp{savepos}
175 \ZREF@temp{titleref}
176 \ZREF@temp{totpages}
177 \ZREF@temp{user}
178 \ZREF@temp{xr}
179 \ProcessOptions\relax
180 (/package)
```

6.2Module base

6.2.1 Prefixes

This package uses the following prefixes for macro names:

\zref@: Macros of the programmer's interface.

\ZREF@: Internal macros.

\ZQLQ *listname*: The properties of the list $\langle listname \rangle$.

\Z@D@propname: The default value for property $\langle propname \rangle$.

 $\Z@E@propname: Extract function for property \langle propname \rangle$.

\Z@X@propname: Information whether a property value for property \(\lambda propname \)

is expanded immediately or at shipout time.

\Z@C@propname: Current value of the property $\langle propname \rangle$.

\Z@R@labelname: Data for reference $\langle labelname \rangle$.

\ZREF@org@: Original versions of patched commands.

\z: For macros in user land, defined if module user is set.

The following family names are used for keys defined according to the keyval package:

ZREF@TR: Setup for module titleref.

6.2.2 Identification

```
181 (*base)
```

182 \NeedsTeXFormat{LaTeX2e}

183 \ProvidesPackage{zref-base}%

[2009/08/07 v2.4 Module base for zref (HO)]%

6.2.3Utilities

\ZREF@name Several times the package name is used, thus we store it in \ZREF@name.

185 \def\ZREF@name{zref}

\ZREF@ErrorNoLine

An error message for this package without line information is generated by \ZREF@ErrorNoLine

186 \def\ZREF@ErrorNoLine#1#2{%

187 \begingroup

\let\on@line\@empty 188

189 \PackageError\ZREF@name{#1}{#2}%

190 \endgroup

191 }

\ZREF@UpdatePdfTeX \ZREF@UpdatePdfTeX is used as help message text in error messages.

192 \def\ZREF@UpdatePdfTeX{Update pdfTeX.}

\ifZREF@found The following switch is usded in list processing.

193 \newif\ifZREF@found

\ZREF@patch Macro \ZREF@patch first checks the existence of the command and safes it.

194 $\def\ZREF@patch#1{%}$

\begingroup\expandafter\expandafter\expandafter\endgroup 195

\expandafter\ifx\csname #1\endcsname\relax 196

197 \expandafter\@gobble

\else 198

```
199 \expandafter\let\csname ZREF@org@#1\expandafter\endcsname
200 \csname #1\endcsname
201 \expandafter\@firstofone
202 \fi
203 }
```

6.2.4 Check for ε -T_EX

The use of ε -TEX should be standard nowadays for LATEX. We test for ε -TEX in order to use its features later.

```
204 \begingroup
205
     \@ifundefined{eTeXversion}{%
206
       \ZREF@ErrorNoLine{%
         Missing support for eTeX; package is abandoned%
207
208
         Use a TeX compiler that support eTeX and enable eTeX \%
209
          in the format.%
210
       }%
211
212
        \endgroup
213
        \endinput
214
     }{}%
215 \endgroup
216 \RequirePackage{etexcmds}[2007/09/09]
217 \ifetex@unexpanded
218 \ensuremath{\setminus} else
219
     \ZREF@ErrorNoLine{%
       Missing e-TeX's \string\unexpanded.\MessageBreak
220
        Add \string\RequirePackage\string{etexcmds\string} before %
221
        \string\documentclass%
222
223
    }{%
       Probably you are using some package (e.g. ConTeXt) that \%
224
225
       redefines \string\unexpanded%
226
     \expandafter\endinput
227
228 \fi
```

6.2.5 Auxiliary file stuff

We are using some commands in the .aux files. However sometimes these auxiliary files are interpreted by LATEX processes that haven't loaded this package (e.g. package xr). Therefore we provide dummy definitions.

```
229 \RequirePackage{auxhook}
230 \AddLineBeginAux{%
231 \string\providecommand\string\zref@newlabel[2]{}%
232 }
```

\zref@newlabel For the implementation of \zref@newlabel we call the same internal macro \@newl@bel that is used in \newlabel. Thus we have for free:

- \Z@R@labelname is defined.
- LATEX's check for multiple references.
- LATEX's check for changed references.

```
233 \def\zref@newlabel{%
234 \@newl@bel{Z@R}%
235 }
```

6.2.6 Property lists

Property lists are stored as list of property names enclosed in curly braces. \zref@newlist \zref@newlist creates a new list as empty list. Assignments to property lists are global.

```
236 \def\zref@newlist#1{%
237
     \zref@iflistundefined{#1}{%
       \@ifdefinable{Z@L@#1}{%
238
239
        \global\expandafter\let\csname Z@L@#1\endcsname\@empty
240
        \PackageInfo{zref}{New property list: #1}%
241
       }%
242
     }{%
       \PackageError\ZREF@name{%
243
         Property list '#1' already exists%
244
       }\@ehc
245
     }%
246
247 }
```

\zref@iflistundefined

\zref@iflistundefined checks the existence of the property list #1. If the property list is present, then #2 is executed and #3 otherwise.

```
248 \def\zref@iflistundefined#1{%
     \expandafter\ifx\csname Z@L@#1\endcsname\relax
250
       \expandafter\@firstoftwo
251
     \else
       \expandafter\@secondoftwo
252
253
     \fi
254 }
```

\zref@listexists \zref@listexists only executes #2 if the property list #1 exists and raises an error message otherwise.

```
255 \def\zref@listexists#1{%
     \zref@iflistundefined{#1}{%
257
        \PackageError\ZREF@name{%
258
          Property list '#1' does not exist%
        \ \ensuremath{\mbox{Qehc}}
259
     }%
260
261 }
```

\zref@iflistcontainsprop

\zref@iflistcontainsprop checks, whether a property #2 is already present in a property list #1.

```
262 \def\zref@iflistcontainsprop#1{%
     \expandafter\ZREF@iflistcontainsprop\csname Z@L@#1\endcsname
264 }
265 \def\ZREF@iflistcontainsprop#1#2{%
266
     \begingroup
267

\ifZREF@immediate

The switch \ifZREF@immediate tells us, whether the label should be written immediately or at page shipout time. \ZREF@label need to be notified about this, because it must disable the deferred execution of property values, if the label is written immediately.

408 \newif\ifZREF@immediate

\zref@wrapper@immediate

The argument of \zref@wrapper@immediate is executed inside a group where \write is redefined by adding \immediate before its execution. Also \ZREF@label is notified via the switch \ifZREF@immediate.

```
409 \long\def\zref@wrapper@immediate#1{%
     \begingroup
410

6.2.9 Reference querying and extracting

Design goal for the extracting macros is that the extraction process is full expandable. Thus these macros can be used in expandable contexts. But there are problems that cannot be solved by full expandable macros:

- In standard LATEX undefined references sets a flag and generate a warning. Both actions are not expandable.
- Babel's support for its shorthand uses commands that use non-expandable assignments. However currently there is hope, that primitives are added to pdfTEX that allows the detection of contexts. Then the shorthand can detect, if they are executed inside \csname and protect themselves automatically.

\zref@ifrefundefined If a reference #1 is undefined, then macro \zref@ifrefundefined calls #2 and #3 otherwise.

```
453 \def\zref@ifrefundefined#1{%

454 \expandafter\ifx\csname Z@R@#1\endcsname\relax

455 \expandafter\@firstoftwo

456 \else

457 \expandafter\@secondoftwo

458 \fi

459 }
```

```
\zref@refused
```

The problem with undefined references is addressed by the macro \zref@refused. This can be used outside the expandable context. In case of an undefined reference the flag is set to notify LATEX and a warning is given.

\ZREF@refused

```
463 \def\ZREF@refused#1{%

464 \zref@ifrefundefined{#1}{%

465 \protect\G@refundefinedtrue

466 \@latex@warning{%

467 Reference '#1' on page \thepage \space undefined%

468 }%

469 }{}%

470 }
```

\zref@extract

\zref@extract is an abbreviation for the case that the default of the property is used as default value.

```
471 \def\zref@extract#1#2{%
472 \expandafter\expandafter\expandafter\ZREF@extract
473 \expandafter\expandafter\{\}
474 \csname Z@D@#2\endcsname
475 \}{#1}{#2}%
476 \}
477 \def\ZREF@extract#1#2#3{%
478 \zref@extractdefault{#2}{#3}{#1}%
479 \}
```

\zref@ifrefcontainsprop

\zref@ifrefcontainsprop looks, if the reference #1 has the property #2 and calls then #3 and #4 otherwise.

```
480 \def\zref@ifrefcontainsprop#1#2{%
     \zref@ifrefundefined{#1}{%
481
       \@secondoftwo

\expandafter\ZREF@wrapper@babel\expandafter{\x}{#1}%

6.2.12 Setup

\zref@setdefault

Standard IATEX prints "??" in bold face if a reference is not known. \zref@default holds the text that is printed in case of unknown references and is used, if the default was not specified during the definition of the new property by \ref@newprop. The global default value can be set by \zref@setdefault.

```
556 \def\zref@setdefault#1{%
557 \def\zref@default{#1}%
558 }
```

\zref@default

Now we initialize \zref@default with the same value that LATEX uses for its undefined references.

```
559 \zref@setdefault{%
560 \nfss@text{\reset@font\bfseries ??}%
561 }
```

Main property list.

\zref@setmainlist

The name of the default property list is stored in \ZREF@mainlist and can be set by \zref@setmainlist.

```
562 \def\zref@setmainlist#1{%
563 \def\ZREF@mainlist{#1}%
564 }
565 \zref@setmainlist{main}
```

Now we create the list.

566 \zref@newlist\ZREF@mainlist

Main properties. The two properties default and page are created and added to the main property list. They store the data that standard LATEX uses in its references created by \label.

 ${\tt default } \ \ the \ appearance \ of \ the \ latest \ counter \ that \ is \ incremented \ by \ {\tt \ refstepcounter}$

page the apperance of the page counter

```
567 \zref@newprop{default}{\@currentlabel}
568 \zref@newprop*{page}{\thepage}
569 \zref@addprop\ZREF@mainlist{default}
570 \zref@addprop\ZREF@mainlist{page}
```

Mark successful loading

```
571 \let\ZREF@baseok\@empty 572 \langle/base\rangle
```

6.3 Module user

```
573 (*user)
574 \NeedsTeXFormat{LaTeX2e}
575 \ProvidesPackage{zref-user}%
576 [2009/08/07 v2.4 Module user for zref (HO)]%
577 \RequirePackage{zref-base}[2009/08/07]
578 \@ifundefined{ZREF@baseok}{\endinput}{}
```

Module user enables a small user interface. All macros are prefixed by \z. First we define the pendants to the standard LATEX referencing commands \label, \ref, and \pageref.

\zlabel

Similar to \label the macro \zlabel writes a reference entry in the .aux file. The main property list is used. Also we add the babel patch. The \label command can also be used inside section titles, but it must not go into the table of contents. Therefore we have to check this situation.

```
579 \newcommand*\zlabel{%
580 \ifx\label\@gobble
581 \expandafter\@gobble
582 \else
583 \expandafter\zref@wrapper@babel\expandafter\zref@label
584 \fi
585 }%
```

\zref Macro \zref is the corresponding macro for \ref. Also it provides an optional argument in order to select another property.

```
586 \newcommand*{\zref}[2][default]{%
587    \zref@propexists{#1}{%
588    \zref@wrapper@babel\ZREF@zref{#2}{#1}%
589    }%
590 }%
591 \def\ZREF@zref#1{%
592    \zref@refused{#1}%
593    \zref@extract{#1}%
594 }%
```

\zpageref For macro \zpageref we just call \zref with property page.

```
595 \newcommand*\zpageref{%
596 \zref[page]%
597 }%
```

\zrefused

For the following expandible user macros \zrefused should be used to notify LaTeX in case of undefined references.

```
598 \newcommand*{\zrefused}{\zref@refused}%
599 \/ user\
```

6.4 Module abspage

```
600 (*abspage)
601 \NeedsTeXFormat{LaTeX2e}
602 \ProvidesPackage{zref-abspage}%
603 [2009/08/07 v2.4 Module abspage for zref (HO)]%
604 \RequirePackage{zref-base}[2009/08/07]
605 \@ifundefined{ZREF@baseok}{\endinput}{}
```

Module abspage adds a new property abspage to the main property list for absolute page numbers. These are recorded by the help of package atbegshi.

606 \RequirePackage{atbegshi}%

The counter abspage must not go in the clear list of <code>@ckpt</code> that is used to set counters in .aux files of included TeX files.

```
607 \begingroup
608 \let\@addtoreset\@gobbletwo
609 \newcounter{abspage}%
610 \endgroup
611 \setcounter{abspage}{0}%
612 \AtBeginShipout{%
613 \stepcounter{abspage}%
614 }%
615 \zref@newprop*{abspage}[0]{\the\c@abspage}%
616 \zref@addprop\ZREF@mainlist{abspage}%
```

Note that counter abspage shows the previous page during page processing. Before shipout the counter is incremented. Thus the property is correctly written with deferred writing. If the counter is written using \zref@wrapper@immediate, then the number is too small by one.

```
617 (/abspage)
```

6.5 Module counter

```
618 (*counter)

6.9Module perpage

```
693 (*perpage)
694 \NeedsTeXFormat{LaTeX2e}
695 \ProvidesPackage{zref-perpage}%
     [2009/08/07 v2.4 Module perpage for zref (HO)]%
697 \RequirePackage{zref-base} [2009/08/07]
698 \@ifundefined{ZREF@baseok}{\endinput}{}
```

This module resets a counter at page boundaries. Because of the asynchronous output routine page counter properties cannot be asked directly, references are necessary.

For detecting changed pages module abspage is loaded.

699 \RequirePackage{zref-abspage} [2009/08/07]

We group the properties for the needed references in the property list perpage. The property pagevalue records the correct value of the page counter.

```
700 \zref@newprop*{pagevalue}[0]{\number\c@page}
```

```
701 \zref@newlist{perpage}
702 \zref@addprop{perpage}{abspage}
703 \zref@addprop{perpage}{page}
704 \zref@addprop{perpage}{pagevalue}
```

The page value, known by the reference mechanism, will be stored in counter zpage.

705 \newcounter{zpage}

Counter zref@unique helps in generating unique reference names.

706 \zref@require@unique

In order to be able to reset the counter, we hook here into \stepcounter. In fact two nested hooks are used to allow other packages to use the first hook at the beginning of \stepcounter.

```
707 \let\ZREF@org@stepcounter\stepcounter
708 \def\stepcounter#1{%
709 \ifcsname @stepcounterhook@#1\endcsname
710 \csname @stepcounterhook@#1\endcsname
711 \fi
712 \ZREF@org@stepcounter{#1}%
713 }
```

\zmakeperpage

Makro \zmakeperpage resets a counter at each page break. It uses the same syntax and semantics as \MakePerPage from package perpage [5]. The initial start value can be given by the optional argument. Default is one that means after the first \stepcounter on a new page the counter starts with one.

```
714 \newcommand*{\zmakeperpage}{%  
715 \@ifnextchar[\ZREF@makeperpage@opt{\ZREF@makeperpage[\z@]}%  
716 }
```

We hook before the counter is incremented in \stepcounter, package perpage afterwards. Thus a little calculation is necessary.

```

```

6.10 Module titleref

```
766 (*titleref)
767 \NeedsTeXFormat{LaTeX2e}
768 \ProvidesPackage{zref-titleref}%
769 [2009/08/07 v2.4 Module titleref for zref (HO)]%
770 \RequirePackage{zref-base}[2009/08/07]
771 \@ifundefined{ZREF@baseok}{\endinput}{}
```

6.10.1 Implementation

```
772 \RequirePackage{keyval}
```

This module makes section and caption titles available for the reference system. It uses some of the ideas of package nameref and titleref.

\zref@titleref@current

Later we will redefine the section and caption macros to catch the current title and remember the value in \zref@titleref@current.

```
773 \let\zref@titleref@current\@empty
```

Now we can add the property title is added to the main property list.

```
774 \zref@newprop{title}{\zref@titleref@current}% 775 \zref@addprop\ZREF@mainlist{title}%
```

The title strings go into the .aux file, thus they need some kind of protection. Package titleref uses a protected expansion method. The advantage is that this can be used to cleanup the string and to remove \label, \index and other macros unwanted for referencing. But there is the risk that fragile stuff can break.

Therefore package nameref does not expand the string. Thus the entries can safely be written to the .aux file. But potentially dangerous macros such as \label remain in the string and can cause problems when using the string in references.

\ifzref@titleref@expand

The switch \ifzref@titleref@expand distinguishes between the both methods. Package nameref's behaviour is achieved by setting the switch to false, otherwise titleref's expansion is used. Default is false.

776 \newif\ifzref@titleref@expand

\ZREF@titleref@hook

The hook \ZREF@titleref@hook allows to extend the cleanup for the expansion method. Thus unnecessary macros can be removed or dangerous commands removed. The hook is executed before the expansion of \zref@titleref@current.

777 \let\ZREF@titleref@hook\@empty

\zref@titleref@cleanup

The hook should not be used directly, instead we provide the macro \zref@titleref@cleanup to add stuff to the hook and prevents that a previous non-empty content is not discarded accidently.

```
778 \def\zref@titleref@cleanup#1{%
779
      \begingroup
       \toks@\expandafter{%
780
          \ZREF@titleref@hook
781
          #1%
782
       }%
783
784
     \expandafter\endgroup
     \expandafter\def\expandafter\ZREF@titleref@hook\expandafter{%
785
       \the\toks@
786
787
     }%
788 }%
```

\ifzref@titleref@stripperiod

Sometimes a title contains a period at the end. Package nameref removes this. This behaviour is controlled by the switch \ifzref@titleref@stripperiod and works regardless of the setting of option expand. Period stripping is the default.

789 \newif\ifzref@titleref@stripperiod 790 \zref@titleref@stripperiodtrue

\zref@titleref@setcurrent

Macro \zref@titleref@setcurrent sets a new current title stored in \zref@titleref@current. Some cleanup and expansion is performed that can be controlled by the previous switches.

```
791 \def\zref@titleref@setcurrent#1{%
                      \def\zref@titleref@current{#1}%

6.10.3 Patches for section and caption commands

The section and caption macros are patched to extract the title data.

Captions of figures and tables.

```
846 \AtBeginDocument{%
847 \ZREF@patch{@caption}{%
848 \long\def\@caption#1[#2]{%
849 \zref@titleref@setcurrent{#2}%
850 \ZREF@org@@caption{#1}[{#2}]%
851 }%
852 }%
```

Section commands without star. The title version for the table of contents is used because it is usually shorter and more robust.

```
853 \ZREF@patch{@part}{%
854 \def\@part[#1]{%
855 \zref@titleref@setcurrent{#1}%
856 \ZREF@org@@part[{#1}]%

6.11 Module xr

```
940 (*xr)
941 \NeedsTeXFormat{LaTeX2e}
942 \ProvidesPackage{zref-xr}%
943 [2009/08/07 v2.4 Module xr for zref (HO)]%
944 \RequirePackage{zref-base}[2009/08/07]
945 \@ifundefined{ZREF@baseok}{\endinput}{}
946 \RequirePackage{keyval}
```

We declare property url, because this is added, if a reference is imported and has not already set this field. Or if hyperref is used, then this property can be asked.

```
947 \zref@newprop{url}{}%
```

Most code, especially the handling of the .aux files are taken from David Carlisle's xr package. Therefore I drop the documentation for these macros here. If the URL is not specied, then assume processed file with a guessed extension. Use the setting of hyperref if available.

```
948 \providecommand*{\zref@xr@ext}{%
949 \@ifundefined{XR@ext}{pdf}{\XR@ext}%
950 }%
```

\ifZREF@xr@zreflabel

\zref@xr@ext

The use of the star form of \zexternaldocument is remembered in the switch \ifZREF@xr@zreflabel.

 $951 \mbox{\ensuremath{\mbox{Newif}\scalebox{$

\zexternaldocument

In its star form it looks for \newlabel, otherwise for \zref@newlabel. Later we will read .aux files that expects @ to have catcode 11 (letter).

```
952 \newcommand*{\zexternaldocument}{%

953 \begingroup

954 \csname @safe@actives@true\endcsname

955 \makeatletter

956 \@ifstar{%
```

```
957 \ZREF@xr@zreflabelfalse

958 \@testopt\ZREF@xr@externaldocument{}%

959 \{%

960 \ZREF@xr@zreflabeltrue

961 \@testopt\ZREF@xr@externaldocument{}%

962 \}%

963 \}%
```

If the \include featuer was used, there can be several .aux files. These files are read one after another, especially they are not recursively read in order to save read registers. Thus it can happen that the read order of the newlabel commands differs from LATEX's order using \input.

\ZREF@xr@externaldocument

It reads the remaining arguments. \newcommand comes in handy for the optional argument.

```
964 \def\ZREF@xr@externaldocument[#1]#2{%
       \def\ZREF@xr@prefix{#1}%

```

6.12 Module hyperref

6.13 Module savepos

Module savepos provides an interface for pdfTEX's \pdfsavepos, see the manual for pdfTEX.

6.13.1 Identification

6.13.2 Availability

First we check, whether the feature is available.

```
1192 \begingroup
     \@ifundefined{pdfsavepos}{%
1193
        \ZREF@ErrorNoLine{%
1194
1195
          \string\pdfsavepos\space is not supported.\MessageBreak
1196
          It is provided by pdfTeX (1.40) or XeTeX%
1197
        }\ZREF@UpdatePdfTeX
1198
        \endgroup
1199
        \endinput
     }{}%
1200
1201 \endgroup
```

In PDF mode we are done. However support for DVI mode was added later in version 1.40.0. In earlier versions \pdfsavepos is defined, but its execution raises an error. Note that XeT_FX also provides \pdfsavepos.

```
1202 \RequirePackage{ifpdf}
1203 \ifpdf
1204 \else
      \begingroup\expandafter\expandafter\expandafter\endgroup
1205
      \expandafter\ifx\csname pdftexversion\endcsname\relax
1206
1207
      \else
1208
        \ifnum\pdftexversion<140 %
1209
          \ZREF@ErrorNoLine{%
            \string\pdfsavepos\space is not supported in DVI mode\MessageBreak
1210
            of this pdfTeX version%
1211
          }\ZREF@UpdatePdfTeX
1212
          \expandafter\expandafter\expandafter\endinput
1213
1214
        \fi
1215 \fi
1216 \fi
```

6.13.3 Setup

```
1217 \zref@newlist{savepos}
1218 \zref@newprop*{posx}[0]{\the\pdflastxpos}
1219 \zref@newprop*{posy}[0]{\the\pdflastypos}
1220 \zref@addprop{savepos}{posx}
1221 \zref@addprop{savepos}{posy}
```

6.13.4 User macros

\zsavepos The current location is stored in a reference with the given name.

```
1222 \def\zsavepos#1{%
1223  \@bsphack
1224  \if@filesw
1225  \pdfsavepos
1226  \zref@labelbylist{#1}{savepos}%
1227  \fi
1228  \@esphack
1229 }
```

\zposx \zposy The horizontal and vertical position are available by \zposx and \zposy. Do not rely on absolute positions. They differ in DVI and PDF mode of pdfTEX. Use differences instead. The unit of the position numbers is sp.

```
1230 \newcommand*{\zposx}[1]{%
1231 \zref@extract{#1}{posx}%
1232 }%
1233 \newcommand*{\zposy}[1]{%
1234 \zref@extract{#1}{posy}%
1235 }%
```

Typically horizontal and vertical positions are used inside calculations. Therefore the extracting macros should be expandable and babel's patch is not applyable.

Also it is in the responsibility of the user to marked used positions by \zrefused in order to notify LATEX about undefined references.

```
1236 \langle /savepos \rangle
```

6.14 Module dotfill

For measuring the width of **\zdotfill** we use the features provided by module savepos.

```
1243 \RequirePackage{zref-savepos}[2009/08/07]
```

For automatically generated label names we use the unique counter of module base.

```
1244 \zref@require@unique
```

Configuration is done by the key value interface of package keyval.

```
1245 \RequirePackage{keyval}
```

```
The definitions of the keys follow.

1246 \define@key{ZREF@DF}{unit}{%}

1247 \def\ZREF@df@unit{#1}%

1248 }

1249 \define@key{ZREF@DF}{min}{%}

1250 \def\ZREF@df@min{#1}%

1251 }

1252 \define@key{ZREF@DF}{dot}{%}
```

```
1253
                       \def\ZREF@df@dot{#1}%
                 1254 }
                 Defaults are set, see user interface.
                 1255 \providecommand\ZREF@df@min{2}
                 1256 \providecommand\ZREF@df@unit{.44em}
                 1257 \providecommand\ZREF@df@dot{.}
                Configuration of \zdotfill is done by \zdotfillsetup.
\zdotfillsetup
                 1258 \verb|\newcommand*{\zdotfillsetup}{\setkeys{ZREF@DF}}|
                \zdotfill sets labels at the left and the right to get the horizontal position.
     \zdotfill
                 \zsavepos is not used, because we do not need the vertical position.
                 1259 \newcommand*{\zdotfill}{%
                 1260
                       \leavevmode

8 Installation

8.1 Download

1301

\begingroup

Package. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/zref.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/zref.pdf Documentation.

Bundle. All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN: install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

8.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

¹ftp://ftp.ctan.org/tex-archive/

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

8.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain-T_EX:

```
tex zref.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

```
→ tex/latex/oberdiek/zref.sty
zref.sty
zref-base.sty
                          → tex/latex/oberdiek/zref-base.stv
zref-abspage.sty
                          → tex/latex/oberdiek/zref-abspage.sty
zref-counter.sty
                          → tex/latex/oberdiek/zref-counter.sty
zref-dotfill.sty
                          → tex/latex/oberdiek/zref-dotfill.sty
zref-hyperref.sty
                          → tex/latex/oberdiek/zref-hyperref.sty
zref-lastpage.sty
                          → tex/latex/oberdiek/zref-lastpage.sty
zref-perpage.sty
                          → tex/latex/oberdiek/zref-perpage.sty
zref-runs.sty
                          → tex/latex/oberdiek/zref-runs.sty
zref-savepos.sty
                          → tex/latex/oberdiek/zref-savepos.sty
zref-titleref.sty
zref-totpages.sty
zref-user.sty
                          → tex/latex/oberdiek/zref-titleref.sty

ightarrow tex/latex/oberdiek/zref-totpages.sty
zref-user.sty
                          → tex/latex/oberdiek/zref-user.sty
zref-xr.sty
                         → tex/latex/oberdiek/zref-xr.sty
 \begin{array}{ll} {\tt zref.pdf} & \to {\tt doc/latex/oberdiek/zref.pdf} \\ {\tt zref-example.tex} & \to {\tt doc/latex/oberdiek/zref-example.tex} \end{array} 
{\tt zref-example-lastpage.tex} 	o {\tt doc/latex/oberdiek/zref-example-lastpage.tex}
test/zref-test1.tex → doc/latex/oberdiek/test/zref-test1.tex
zref.dtx
                          → source/latex/oberdiek/zref.dtx
```

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

8.4 Refresh file name databases

If your T_EX distribution (te T_EX , mik T_EX , ...) relies on file name databases, you must refresh these. For example, te T_EX users run texhash or mktexlsr.

8.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the .dtx source file. It can be extracted by AcrobatReader 6 or higher. Another option is pdftk, e.g. unpack the file into the current directory:

```
pdftk zref.pdf unpack_files output .
```

Unpacking with LATEX. The .dtx chooses its action depending on the format:

plain-TEX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using \LaTeX for docstrip (really, docstrip does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{zref.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

\PassOptionsToClass{a4paper}{article}

An example follows how to generate the documentation with pdfLATEX:

```
pdflatex zref.dtx
makeindex -s gind.ist zref.idx
pdflatex zref.dtx
makeindex -s gind.ist zref.idx
pdflatex zref.dtx
```

10 History

[2006/02/20 v1.0]

• First version.

[2006/05/03 v1.1]

- Module perpage added.
- Module redesign as packages.

[2006/05/25 v1.2]

- Module dotfillmin added.
- Module base: macros \zref@require@uniqe and \thezref@unique added (used by modules titleref and dotfillmin).

[2006/09/08 v1.3]

• Typo fixes and English cleanup by Per Starback.

[2007/01/23 v1.4]

• Typo in macro name fixed in documentation.

[2007/02/18 v1.5]

- \zref@getcurrent added (suggestion of Igor Akkerman).
- Module savepos also supports XeTeX.

[2007/04/06 v1.6]

- Fix in modules abspage and base: Now counter abspage and zref@unique are not remembered by \include.
- Beamer support for module titleref.

[2007/04/17 v1.7]

• Package atbegshi replaces everyshi.

[2007/04/22 v1.8]

• \zref@wrapper@babel and \zref@refused are now expandable if babel is not used or \if@safe@actives is already set to true. (Feature request of Josselin Noirel)

[2007/05/02 v1.9]

• Module titleref: Some support for \caption of package longtable, but only if \label is given after \caption.

[2007/05/06 v2.0]

• Uses package etexcmds for accessing ε -TFX's \unexpanded.

[2007/05/28 v2.1]

- Module titleref supports caption of package listings.
- Fixes in module titleref for support of packages titlesec and longtable.

[2008/09/21 v2.2]

• Module base: \zref@iflistcontainsprop is documented, but a broken \zref@listcontainsprop implemented. Name and implementation fixed (thanks Ohad Kammar).

[2008/10/01 v2.3]

- \zref@localaddprop added (feature request of Ohad Kammar).
- Module lastpage: list 'LastPage' added. Label 'LastPage' will use the properties of this list (default is empty) along with the properties of the main list.

[2009/08/07 v2.4]

• Module runs added.

11 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
