Petiteannonce package documentation

Vincent Belaïche

May 2, 2008

1 Introduction

This is the documentation of the petiteannonce package. The aim of this package is to make adverts that you would pin down on some notice board in a mall with your phone number repeated on strips. This practice is quite common in France as it is simple, cheap (no fee for intermediates like eBayTM), and allows you to reach people in the same neighbourhood (so no need for postal fee either).

2 Commands

There are two commands the \petiteannonce command and the \petiteannoncewidth command.

2.1 The \petiteannonce command

The \petiteannonce command is used to create the advertisement. It takes two mandatory arguments and one optional argument.

- The 1st mandatory argument is the phone number or email address where to reach the seller.
- The 2nd mandatory argument is the text of the advert itself
- The optional argument is a list of comma separated < key >=< value > arguments that allows to configure a number of additional things. Absence of the key is equivalent to setting it to its default value. The supported keys are the following:
 - cols positive integer with default value 1. Specifies the number of columns of the document that is used to compute the width of the advert. When the advert is repeated, a new paragraph is generated every cols columns.
 - count positive integer with default value 1. Tells the number of times the advert is repeated.

- cutvspace dimension with default value 10pt. Tell the vertical space under to horizontal dotted line that is provided for cutting one strip.
- skip non negative integers with default value 0. The value shall be less than *cols*. Specifies that the first *skip* advert are not generated. This may be useful when you want to make several adverts in the same document.
- texthspace dimension with default value 20pt. This key allows to specify the space evenly placed before and after advert text.
- texthspace dimension with default value 10pt. This key allows to specify the space evenly placed above and below text.
- telcolsep dimension with default value 10pt. This key allows to specify the separation between to telephone strips, that is to say the horizontal space between the telephone numbers.
- telrulewidth dimension with default value 0.5pt. Width of the vertical rule separating two telephone strips.
- telvspace dimension with default value 10pt. Vertical space shared equally above and below the telephone number in the strip (this space is one the before and after the number if you look at the strip horizontally).
- width dimension with default value \textwidth. Overloads the value computed with cols. In such a case take care to place the width argument after the cols argument.

2.2 The \petiteannoncewidth command

The \petiteannoncewidth command takes one argument #1 and expands into $#1 \times$ the width of the advert. This is useful when you use a tabular to make the text of the advert.

3 Sample code

The following sample code will expand into the advertisement page at the page this sample code.

\documentclass{petiteannonce}
\usepackage{SIunits}
\usepackage{graphicx}
\usepackage{array}
\usepackage{eurosym}
\begin{document}

\petiteannonce[count=4,cols=2]%
{02 99 yy yy yy}

```
