PSTricks

pstricks-add additionals Macros for pstricks v.3.35

Package author(s): **Dominique Rodriguez Herbert Voß**

This version of pstricks-add needs pstricks.tex version >1.04 from June 2004, otherwise the additional macros may not work as expected. The ellipsis material and the option asolid (renamed to eofill) are now part of the new pstricks.tex package, available at CTAN or at http://perce.de/LaTeX/. pstricks-add will for ever be an experimental and dynamical package, try it at your own risk.

- It is important to load pstricks-add as the **last** PSTricks related package, otherwise a lot of the macros won't work in the expected way.
- pstricks-add uses the extended version of the keyval package. So be sure that
 you have installed pst-xkey which is part of the xkeyval-package, and that all
 packages that use the old keyval interface are loaded before the xkeyval.[1]
- the option tickstyle from pst-plot is no longer supported; use ticksize instead.
- the option xyLabel is no longer supported; use the option labelFontSize instead
- if pstricks-add is loaded together with the package pst-func then InsideArrow of the \psbezier macro doesn't work!

1. Numeric functions 7

Part I. pstricks

1. Numeric functions

All macros have a @ in their name, because they are only for internal use, but it is no problem to use them like other macros. One can define another name without a @:

```
\makeatletter
\let\pstdivide\pst@divide
\makeatother
```

or put the macro inside the \makeatletter - \makeatother sequence.

1.1. \pst@divide

pstricks itself has its own divide macro, called pst@divide, which can divide two lengths and save the quotient as a floating point number:

this gives the output 5.66666. The result is not a length!

1.2. \pst@mod

pstricks-add defines an additional numeric function for the modulus:

```
\verb|\pst@mod{integer}{integer}{result\ as\ a\ macro}|
```

this gives the output 4. Using this internal numeric function in documents requires a setting inside the makeatletter and makeatother environment. It makes some sense to define a new macroname in the preamble and use it throughout, e.g. \let\modulo\pst@mod.

1.3. \pst@max 8

1.3. \pst@max

\pst@max{integer}{integer}{result as count register}

1.4. \pst@maxdim

\pst@maxdim{dimension}{dimension}{result as a dimension register}

```
1234.0pt
1234.0pt
967.39369pt
1234.0pt
1234
```

1.5. \pst@mindim

\pst@mindim{dimension}{dimension}{result as dimension register}

```
967.39369pt
123.0pt

\[
\text{\newdimen\minDim}{\makeatletter} \
\text{\pst@mindim{34cm}{1234pt}\minDim \the\minDim}{\makeatother} \\
\text{\makeatother}
\]
\[
\text{\newdimen\minDim}{\makeatother} \\
\text{\makeatother}
\]
\[
\text{\makeatother}
\]
```

1.6. \pst@abs

\pst@abs{integer}{result as a count register}

1.7. \pst@absdim

\pst@absdim{dimension}{result as a dimension register}

```
newdimen\absDim
nmakeatletter
yef7.39369pt
0.00006pt
verify the labsDim letter
nmakeatother

newdimen\absDim
letter
nmakeatletter
newdimen\absDim
letter
letter
newdimen\absDim
letter
letter
newdimen\absDim
letter
l
```

1.8. \pst@int **9**

1.8. \pst@int

\pst@int{number}{result as a truncated integer}

1.9. \pstFPDiv

\pstFPDiv{result as a truncated integer}{number}{number}

```
-145
-0
7
-145
-0
7
-145
-0
7
-145
-0
7
-0

```

1.10. \psGetSlope

 $\protect\pro$

```
0.0
2.0
-0.2
0.00615

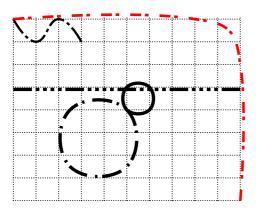

\begin{align*}
\text{psGetSlope(-2,1)(3,1)\SlopeVal \SlopeVal\\ \slopeVal \SlopeVal\\ \slopeVal \SlopeVal \SlopeVal\\ \slopeVal \SlopeVal \SlopeVal\\ \slopeVal \SlopeVal \SlopeVal\\ \text{psGetSlope(-2111,-12)(3,1)\SlopeVal \SlopeVal} \\
\text{psGetSlope(-2111,-12)(3,1)\SlopeVal \SlopeVal} \\
\end{align*}
```

2. Dashed Lines

2. Dashed Lines

Tobias Nähring has implemented an enhanced feature for dashed lines. The number of arguments is no longer limited.

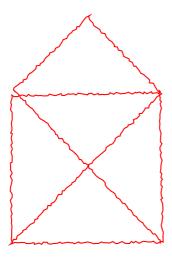

```
dash=value1 unit value2 unit ...
```

```
\psset{linewidth=2.5pt,unit=0.6}
\begin{array}{c} \mathbf{begin} \{ pspicture \} (-5, -4) (5, 4) \end{array}
\psgrid[subgriddiv=0,griddots=10,
  gridlabels=0pt]
 \psset{linestyle=dashed}
 \pscurve[dash=5mm 1mm 1mm,linewidth
   =0.1](-5,4)(-4,3)(-3,4)(-2,3)
 \psline[dash=5mm 1mm 1mm 1mm 1mm 1mm
   1mm 1mm 1mm](-5,0.9)(5,0.9)
 \protect\operatorname{psccurve}[linestyle=solid](0,0)(1,0)(1,1)
   (0,1)
 \psccurve[linestyle=dashed,dash=5mm 2mm
   0.1 0.2,linetype=0](0,0)(-2.5,0)
   (-2.5, -2.5)(0, -2.5)
 \pscurve[dash=3mm 3mm 1mm,linecolor=
   red, linewidth=2pt](5,-4)(5,2)(4.5,3.5)
   (3,4)(-5,4)
\end{pspicture}
```

3. "'Handmade"' lines :-)

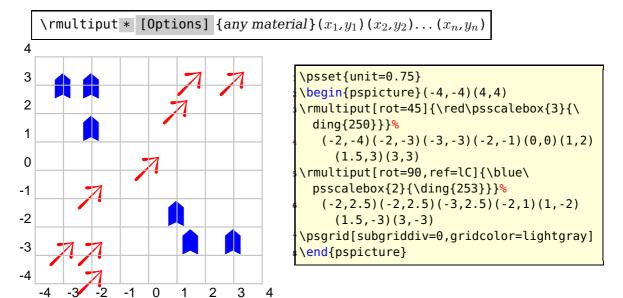

\pslineByHand [Options] $(()(x_1,y_1))(()(x_2,y_2))(()(x_3,y_3)) \dots$

 $\begin{pspicture}(\linewidth,3) \\ \mbox{$\arraycolor=blue}(0,\rA)(\linewidth,\rA)$ \\ \end{pspicture} \label{pspicture}$

4. \rmultiput: a multiple \rput

PSTricks already has a \multirput, which puts a box n times with a difference of dx and dy relative to each other. It is not possible to put it with a different distance from one point to the next. This is possible with \rmultiput:

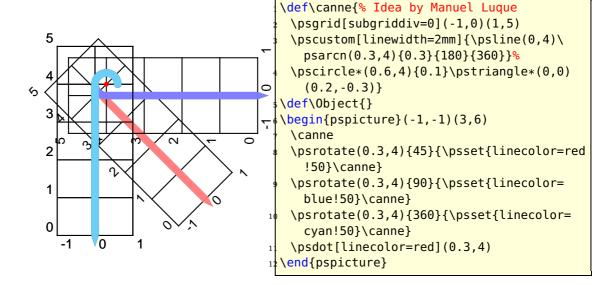

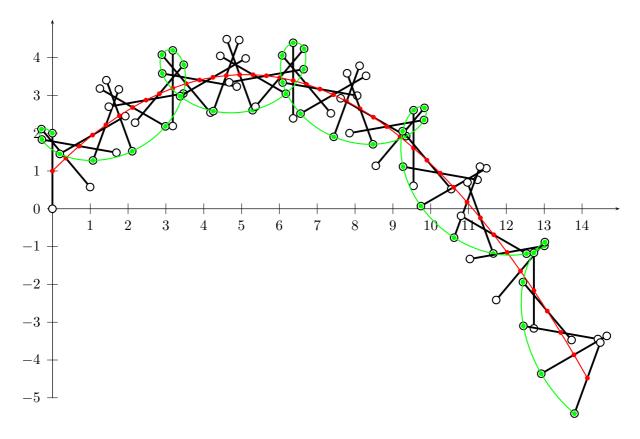

5. \psrotate: Rotating objects

\rput also has an optional argument for rotating objects, but it always depends on the \rput coordinates. With \psrotate the rotating center can be placed anywhere. The rotation is done with \pscustom, all optional arguments are only valid if they are part of the \pscustom macro.

 $\verb|\psrotate| [Options]| (x,y) \{rot\ angle\} \{object\}$

```
\psset{unit=0.75}
 4
                                    3
                                     psaxes{->}(0,0)(-0.5,-3)(8.5,4.5)
                                     \psdots[linecolor=red,dotscale=1.5](2,1)
 2
                                     \psarc[linecolor=red,linewidth=0.4pt,
                                       showpoints=true]
 1
                                          \{->\}(2,1)\{3\}\{0\}\{60\}
                                     \pspolygon[linecolor=green,linewidth=1pt
                                       ](2,1)(5,1.1)(6,-1)(2,-2)
-1
                                     \psrotate(2,1){60}{%
                                       \pspolygon[linecolor=blue,linewidth=1pt
-2
                                        ](2,1)(5,1.1)(6,-1)(2,-2)
                                    \end{pspicture}
-3
```

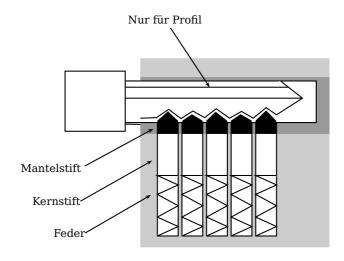

```
\def\majorette{\psline[linewidth=0.5mm](0,2)% Idea by Manuel Luque

```

7. \psChart: a pie chart

 $\verb|\psChart [Options]| \{ comma separated value \ list \} \{ comma separated \ value \ list \} \{ radius \}$

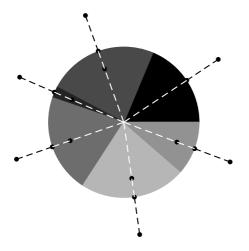

The special optional arguments for the \psChart macro are as follows:

name	description	default
chartSep	distance from the pie chart center to an outraged pie piece	10pt
chartColor	gray or colored pie (values are: gray or color)	gray
userColor	a comma separated list of user defined colors for the pie	{}

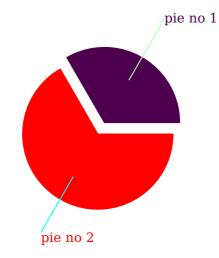

The first mandatory argument is the list of the values and may not be empty. The second one is a list of outraged pieces, numbered consecutively from 1 to up the total number of values. The list of user defined colors must be enclosed in braces!

The macro \psChart defines for every value three nodes at the half angle and in distances from 0.75, 1, and 1.25 times of the radius from the origin. The nodes are named as psChartI?, psChart?, and psChart0?, where ? is the number of the pie. The letter I leads to the inner node and the letter O to the outer node. The distance can be changed with the optional arguments chartNodeI and chartNodeO in the usual way with \psset{chartNodeI=...,chartNodeO=...}.

The other one is the node on the circle line. The origin is by default (0,0). Moving the pie to another position can be done as usual with the \rput-macro. The used colors are named internally as chartFillColor? and can be used by the user for coloring lines or text.

```

```

8. \psHomothetie: central dilatation

9. \psbrace **20**

9. \psbrace

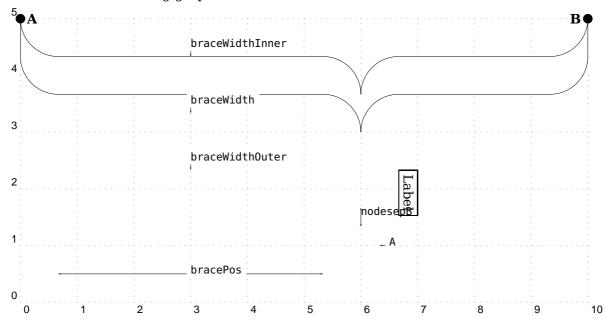

9.1. Syntax

The option \specialCoor is enabled, so that all types of coordinates are possible, (nodename), (x,y), (nodeA|nodeB), ... The star version fills the inner of the brace with the current linecolor. With the fillcolor white or any other background color the brace can be "'unfilled"'.

9.2. Options

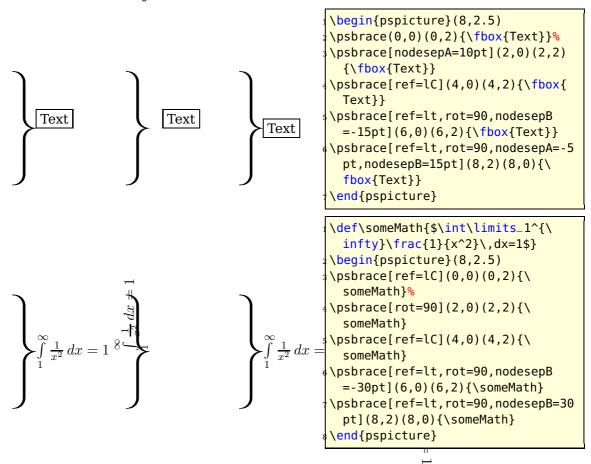

Additional to all other available options from pstricks or the other related packages, there are two new option, named braceWidth and bracePos. All important ones are shown in the following graphics and table.

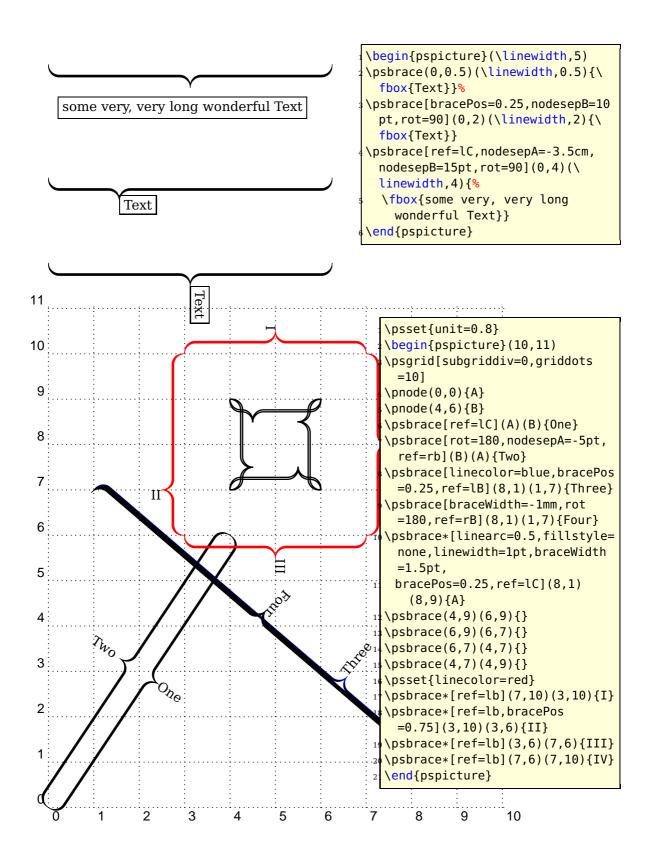

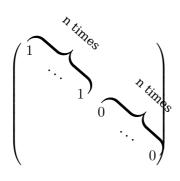

A positive value for nodesepA and nodesepB shifts the label to the upper right and a negative value to the lower left. This does not depends on the value for the rotating of the label!

name	meaning
braceWidth	default is \pslinewidth
braceWidthInner	default is 10\pslinewidth
braceWidthOuter	default is 10\pslinewidth
bracePos	relative position (default is 0.5)
nodesepA	x-separation (default is $0pt$)
nodesepB	y-separation (default is $0pt$)
rot	additional rotating for the text (default is 0)
ref	reference point for the text (default is c)
fillcolor	default is black

By default the text is written perpendicular to the brace line and can be changed with the pstricks option rot=... The text parameter can take any object and may also be empty. The reference point can be any value of the combination of l (left) or r (right) and b (bottom) or B (Baseline) or C (center) or t (top), where the default is c, the center of the object.

It is also possible to put a vertical brace around a default paragraph. This works by setting two invisible nodes at the beginning and the end of the paragraph. Indentation is possible with a minipage.

10. Random dots

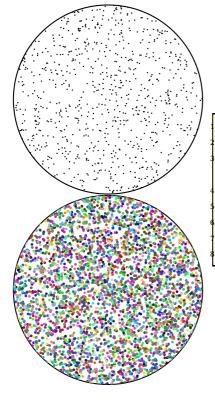

10. Random dots

The syntax of the new macro \psRandom is:

```
\label{eq:psRandom} $$ \operatorname{Options} \{ \} $$ \operatorname{PsRandom} [\operatorname{Options}] (x_{Min}, y_{Min}) (x_{Max}, y_{Max}) \{ clip \ path \} $$
```

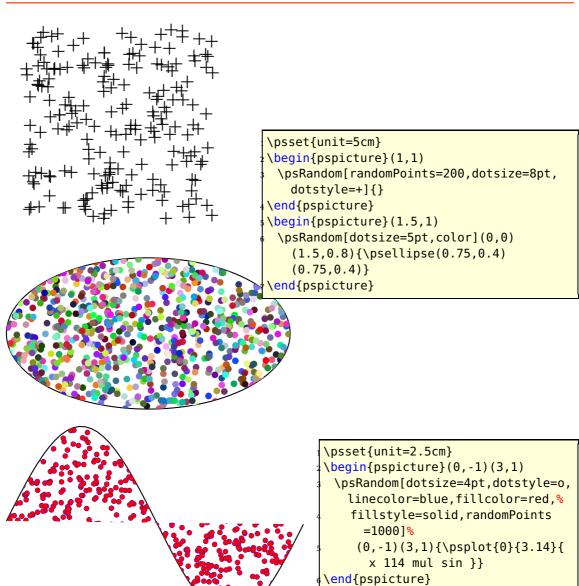

If there is no area for the dots defined, then (0,0)(1,1) in the current scale setting is used for placing the dots. If there is only one (x_{Max},y_{Max}) defined, then (0,0) is used for the other point. This area should be greater than the clipping path to be sure that the dots are placed over the full area. The clipping path can be everything. If no clipping path is given, then the frame (0,0)(1,1) in user coordinates is used. The new options are:

name	default	
randomPoints	1000	number of random dots
color	false	random color

```
\psset{unit=5cm}
\begin{pspicture}(1,1)
  \psRandom[dotsize=1pt,fillstyle=solid](1,1){\
    pscircle(0.5,0.5){0.5}}
\end{pspicture}
\begin{pspicture}(1,1)
  \psRandom[dotsize=2pt,randomPoints=5000,color,%
    fillstyle=solid](1,1){\pscircle(0.5,0.5){0.5}}
\end{pspicture}
```

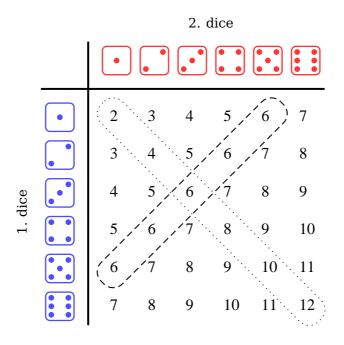

10. Random dots

11. Dice 27

11. Dice

\psdice creates the view of a dice. The number on the dice is the only parameter. The optional parameters, like the color can be used as usual. The macro is a box of dimension zero and is placed at the current point. Use the \rput macro to place it anywhere. The optional argument unit can be used to scale the dice. the default size of the dice $1 \text{cm} \times 1 \text{cm}$.

```
\begin{array}{l} \begin{array}{l} \textbf{begin} & (-1, -1) & (8, 8) \end{array} \end{array}
  \multido{\iA=1+1}{6}{%
   \rput(! -0.5 7 \iA\space sub){\Huge\psdice[unit=0.75,linecolor=blue!70]{\
     iA}}%
   \multido{\iB=1+1}{6}{%
     \rput(! \iA\space 7 \iB\space sub){%
      \rnode[c]{p\iA\iB}{\makebox[1em][l]{\strut\psPrintValue[fontscale=12]{\
        iA\space \iB\space add}}}%
8 }}
 \ncbox[linearc=0.35,nodesep=0.2,linestyle=dotted]{p11}{p66}
10 \ncbox[linearc=0.35,nodesep=0.2,linestyle=dashed]{p15}{p51}
11 \rput{90}(-1.5,3.5){1. dice}
12 \rput{0}(3.5,8.5){2. dice}
13 \psline[linewidth=1.5pt](0.25,0.5)(0.25,8)
14 \psline[linewidth=1.5pt](-1,6.75)(6.5,6.75)
15 \end{pspicture}
```

12. Arrows 28

12. Arrows

12.1. Definition

pstricks-add defines the following "'arrows"':

Value	Example	Name
-		None
<->	←	Arrowheads.
>-<		Reverse arrowheads.
<<->>	***	Double arrowheads.
>>-<<	» «	Double reverse arrowheads.
-		T-bars, flush to endpoints.
*- *		T-bars, centered on endpoints.
[-]		Square brackets.
] - [[Reversed square brackets.
(-)	()	Rounded brackets.
) - ()———(Reversed rounded brackets.
0-0	00	Circles, centered on endpoints.
-	•	Disks, centered on endpoints.
00-00	oo	Circles, flush to endpoints.
-	•	Disks, flush to endpoints.
<->	├	T-bars and arrows.
>-<	——	T-bars and reverse arrows.
h-h		left/right hook arrows.
H-H	>	left/right hook arrows.
v - v	←→	left/right inside vee arrows.
V-V	>	left/right outside vee arrows.
f-f		left/right inside filled arrows.
F-F		left/right outside filled arrows.
t-t		left/right inside slash arrows.
T-T		left/right outside slash arrows.

You can also mix and match, e.g., \rightarrow , *-) and [-> are all valid values of the arrows parameter. The parameter can be set with

```
\psset{arrows=<type>}

or for some macros with a special option, like

\psline[<general options>]{<arrow type>}(A)(B)

\psline[linecolor=red,linewidth=2pt]{|->}(0,0)(0,2)
```

12.2. Multiple arrows

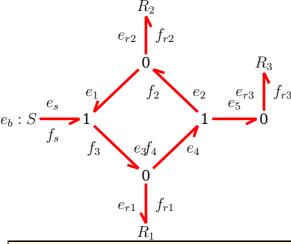

There are two new options which are only valid for the arrow type << or >>. nArrow sets both, the nArrowA and the nArrowB parameter. The meaning is declared in the following tables. Without setting one of these parameters the behaviour is like the one described in the old PSTricks manual.

12.3. hookarrow **29**

Value	Meaning
->>	-A
<<->>	A-A
<<-	A-
>>-	B-
-<<	-B
>>-<<	B-B
>>->>	B-A
<<<	A-B

Value Example $psline{->>}(0,1ex)(2.3,1ex)$ $\prootember \prootember \pro$ \psline[nArrowsA=5]{->>}(0,1ex)(2.3,1ex) $psline{<<-}(0,1ex)(2.3,1ex)$ $\proonup [nArrowsA=3] {<<-} (0, 1ex) (2.3, 1ex)$ $\prootember \prootember \pro$ $psline{<<->>}(0,1ex)(2.3,1ex)$ \psline[nArrowsA=3]{<<->>}(0,1ex)(2.3,1ex) \psline[nArrowsA=5]{<<->>}(0,1ex)(2.3,1ex) $psline{<<-|}(0,1ex)(2.3,1ex)$ $\proonup [nArrowsA=3] {<<-<<} (0,1ex)(2.3,1ex)$ $\proonup [nArrowsA=5] {<<-0} (0,1ex) (2.3,1ex)$ $\psline[nArrowsA=3,nArrowsB=4]{<<-<}(0,lex)(2.3,lex)$ $\proonup [nArrowsA=3, nArrowsB=4] {>>->>} (0, 1ex) (2.3, 1ex)$ $\proonup [nArrowsA=1, nArrowsB=4] {>>->>} (0, 1ex) (2.3, 1ex)$

12.3. hookarrow

```
\psset{arrowsize=8pt,arrowlength=1,linewidth=1pt,nodesep=2pt,shortput=tablr}

large

begin{psmatrix}[colsep=12mm,rowsep=10mm]

& & $R_2$ \\
& & 0 & & $R_3$\\
```

12.4. hookrightarrow and hookleftarrow

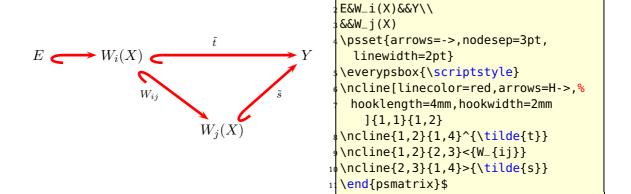

This is another type of arrow and is abbreviated with H. The length and width of the hook is set by the new options hooklength and hookwidth, which are by default set to

```
\psset{hooklength=3mm,hookwidth=1mm}
```

If the line begins with a right hook then the line ends with a left hook and vice versa:

```
hegin{pspicture}(3,4)
psline[linewidth=5pt,linecolor=blue,hooklength=5mm,
hookwidth=-3mm]{H->}(0,3.5)(3,3.5)
psline[linewidth=5pt,linecolor=red,hooklength=5mm,
hookwidth=3mm]{H->}(0,2.5)(3,2.5)
psline[linewidth=5pt,hooklength=5mm,hookwidth=3mm]{H-H
}(0,1.5)(3,1.5)
psline[linewidth=1pt]{H-H}(0,0.5)(3,0.5)
end{pspicture}
```

\$\begin{psmatrix}

12.5. ArrowInside Option

It is now possible to have arrows inside lines and not only at the beginning or the end. The new defined options

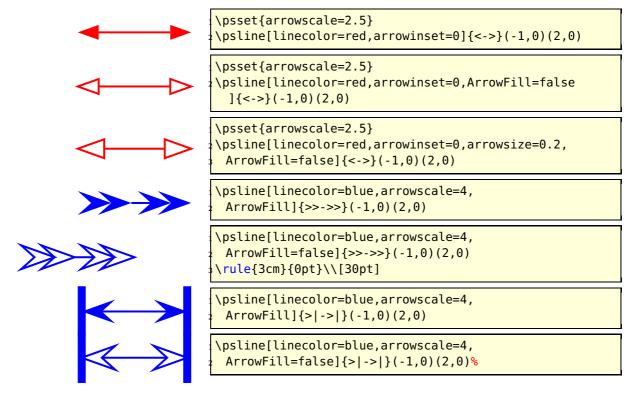

Name	Example	Output
ArrowInside	\psline[ArrowInside=->](0,0)(2,0)	
ArrowInsidePos	\psline[ArrowInside=->,%	
	ArrowInsidePos=0.25](0,0)(2,0)	
ArrowInsidePos	\psline[ArrowInside=->,%	****
	ArrowInsidePos=10](0,0)(2,0)	
ArrowInsideNo	\psline[ArrowInside=->,%	$\rightarrow \rightarrow$
	ArrowInsideNo=2](0,0)(2,0)	
ArrowInsideOffset	\psline[ArrowInside=->,%	\longrightarrow
	ArrowInsideNo=2,%	
	ArrowInsideOffset= 0.1](0,0)(2,0)	
ArrowInside	\psline[ArrowInside=->]{->}(0,0)(2,0)	$\rightarrow \rightarrow$
ArrowInsidePos	\psline[ArrowInside=->,%	→
	ArrowInsidePos=0.25]{->}(0,0)(2,0)	
ArrowInsidePos	\psline[ArrowInside=->,%	>>>>>
	ArrowInsidePos=10]{->}(0,0)(2,0)	
ArrowInsideNo	\psline[ArrowInside=->,%	$\rightarrow \rightarrow \rightarrow$
	ArrowInsideNo=2]{->}(0,0)(2,0)	
ArrowInsideOffset	\psline[ArrowInside=->,%	$\longrightarrow \longrightarrow$
	ArrowInsideNo=2,%	
	ArrowInsideOffset=0.1]{->}(0,0)(2,0)	
ArrowFill	\psline[ArrowFill=false,%	─
	arrowinset=0]{->}(0,0)(2,0)	
ArrowFill	\psline[ArrowFill=false,%	
	arrowinset=0]{«-»}(0,0)(2,0)	
ArrowFill	\psline[ArrowInside=->,%	$\rightarrow \rightarrow $
	arrowinset=0,%	
	ArrowFill=false,%	
	ArrowInsideNo=2,%	
	ArrowInsideOffset= 0.1 {->}(0,0)(2,0)	

Without the default arrow definition there is only the one inside the line, defined by the type and the position. The position is relative to the length of the whole line. 0.25 means at 25% of the line length. The peak of the arrow gets the coordinates which are calculated by the macro. If you want arrows with an absolute position difference, then choose a value greater than 1, e.g. 10 which places an arrow every 10 pt. The default unit pt cannot be changed.

The ArrowInside takes only arrow definitions like -> into account. Arrows from right to left (<-) are not possible and ignored. If you need such arrows, change the order of the pairs of coordinates for the line or curve macro.

12.6. ArrowFill Option

By default all arrows are filled polygons. With the option ArrowFill=false there are "white" arrows. Only for the beginning/end arrows are they empty, the inside arrows are overpainted by the line.

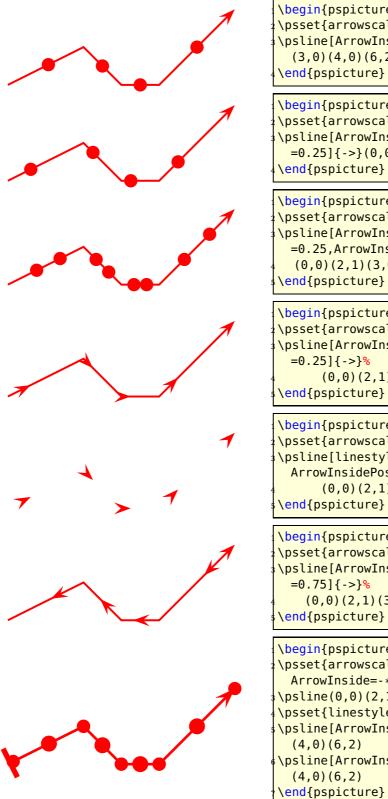

12.7. Examples

All examples are printed with \psset{arrowscale=2,linecolor=red}.

\psline

```

            =20]\{|-|\}(0,0)(4,4)
           \naput[labelsep=0.3]{\large$k$}
           \end{pspicture}
```

12.8. Special arrows v-V,t-T, and f-F

Possible optional arguments are

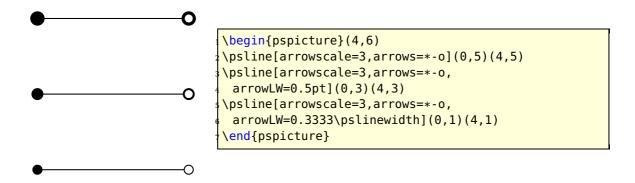

name		meaning	
	veearrowlength	default is 3mm	
	veearrowangle	default is 30	
	veearrowlinewidth	default is 0.35mm	
	filledveearrowlength	default is 3mm	
	filledveearrowangle	default is 15	
	filledveearrowlinewidth	default is 0.35mm	
	tickarrowlength	default is 1.5mm	
	tickarrowlinewidth	default is 0.35mm	
		•	

12.9. Special arrow option arrowLW

Only for the arrowtype o and * it is possible to set the arrowlinewidth with the optional keyword arrowLW. When scaling an arrow by the keyword arrowscale the width of the

borderline is also scaled. With the optional argument <code>arrowLW</code> the line width can be set separately and is not taken into account by the scaling value.

13. \psFormatInt

13. \psFormatInt

There exist some packages and a lot of code to format an integer like $1\,000\,000$ or 1,234,567 (in Europe 1.234.567). But all packages expect a real number as argument and cannot handle macros as an argument. For this case pstricks-add has a macro \psFormatInt which can handle both:

With the option intSeparator the symbol can be changed to any any non-number character.

14. Color

14.1. Transparent colors

Transparency is now part of the main pstricks package. But pay attention, the names and syntax have changed and you need to run ps2pdf with the option -dCompatibilityLevel=1.4.

14.2. "Manipulating transparent colors"

pstricks-add supports real transparency and a simulated one with hatch lines:

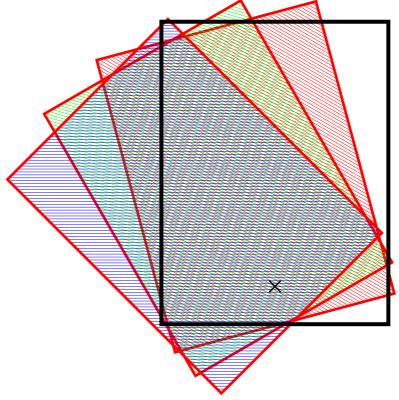

```
\def\defineTColor{\@ifnextchar[{\defineTColor@i}{\defineTColor@i[]}}

\def\defineTColor@i[#1]#2#3{% transparency "Colors"
   \newpsstyle{#2}{%
    fillstyle=vlines,hatchwidth=0.1\pslinewidth,
    hatchsep=1\pslinewidth,hatchcolor=#3,#1%
   }%
}

\defineTColor{TRed}{red}
\defineTColor{TGreen}{green}
\defineTColor{TBlue}{blue}
```

There are three predefined "'transparent"' colors TRed, TGreen, TBlue. They are used as PSTricks styles and not as colors:

14.3. Calculated colors 42

```
begin{pspicture}(-3,-5)(5,5)

psframe(-1,-3)(5,5) % objet de base

psrotate(2,-2){15}{%
    \psframe[style=TRed](-1,-3)(5,5)}

psrotate(2,-2){30}{%
    \psframe[style=TGreen](-1,-3)(5,5)}

psrotate(2,-2){45}{%
    \psframe[style=TBlue](-1,-3)(5,5)}

psframe[linewidth=3pt](-1,-3)(5,5)

psdots[dotstyle=+,dotangle=45,dotscale=3](2,-2) % centre de la rotation
| \end{pspicture}
```

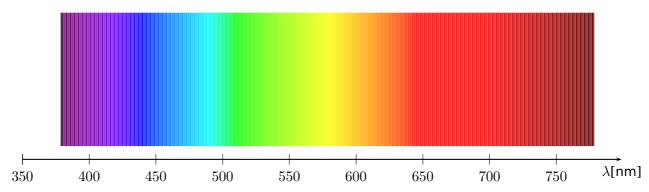

14.3. Calculated colors

The xcolor package (version 2.6) has a new feature for defining colors:

```
\definecolor[ps]{<name>}{<model>}{< PS code >}
```

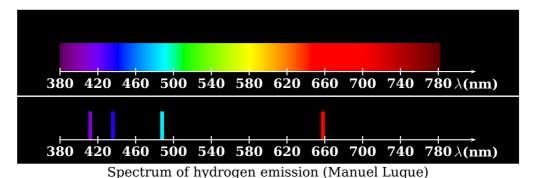

model can be one of the color models, which PostScript will understand, e.g. rgb. With this definition the color is calculated on the PostScript side.

14.3. Calculated colors 43

```
\definecolor[ps]{bl}{rgb}{tx@addDict begin Red Green Blue end}%
\psset{unit=1bp}
\begin{pspicture}(0,-30)(400,100)

```

14.4. Gouraud shading

Gouraud shading is a method used in computer graphics to simulate the differing effects of light and colour across the surface of an object. In practice, Gouraud shading is used to achieve smooth lighting on low-polygon surfaces without the heavy computational requirements of calculating lighting for each pixel. The technique was first presented by Henri Gouraud in 1971.

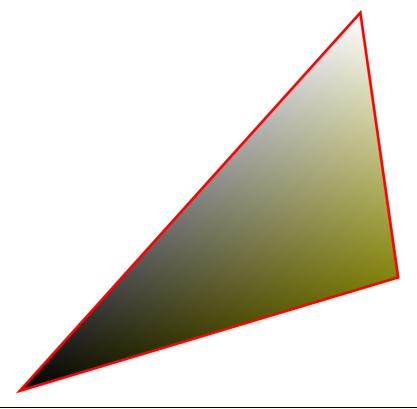

http://www.wikipedia.org

PostScript level 3 supports this kind of shading and it can only be seen with Acroread 7 or later. The syntax is easy:

 $\psGTriangle(x1,y1)(x2,y2)(x3,y3){color1}{color2}{color3}$

 $\begin{pspicture}(0,-.25)(10,10)\\ \psGTriangle(0,0)(5,10)(10,0){red}{green}{blue}\\ \end{pspicture}$

\begin{pspicture}(0,-.25)(10,10)
\psGTriangle*(0,0)(9,10)(10,3){black}{white!50}{red!50!green!95}
\end{pspicture}

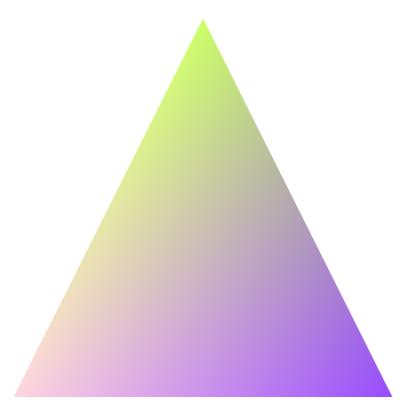

```
\begin{pspicture}(0,-.25)(10,10)

\psGTriangle*(0,0)(5,10)(10,0){-red!100!green!84!blue!86}

{-red!80!green!100!blue!40}

{-red!60!green!30!blue!100}

\end{pspicture}
```

```
\definecolor{rose}{rgb}{1.00, 0.84, 0.88}

\definecolor{vertpommepasmure}{rgb}{0.80, 1.0, 0.40}

\definecolor{fushia}{rgb}{0.60, 0.30, 1.0}

\begin{pspicture}(0,-.25)(10,10)

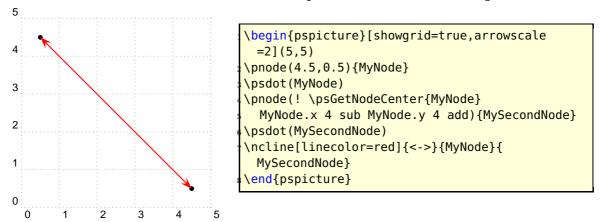

\psGTriangle(0,0)(5,10)(10,0){rose}{vertpommepasmure}{fushia}

\end{pspicture}
```

Part II. pst-node

15. Relative nodes with \psGetNodeCenter

The command \psGetNodeCenter{node} makes sense only at the PostScript level. It defines the two variables node.x and node.y which can be used to define relative nodes. The following example defines the node MyNode and a second one relative to the first one, with 4 units left and 4 units up. node must be an existing node name.

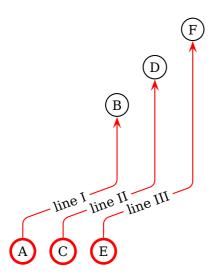

16. \ncdiag and \pcdiag

With the new option lineAngle the lines drawn by the \ncdiag macro can now have a specified gradient. Without this option one has to define the two arms (which maybe zero) and PSTricks draws the connection between them. Now there is only a static armA, the second one armB is calculated when an angle lineAngle is defined. This angle is the gradient of the intermediate line between the two arms. The syntax of \ncdiag is

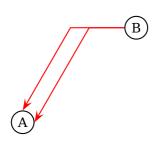

<pre>\ncdiag[<options>]{<node b="">}</node></options></pre>
\pcdiag[<options>](<node a="">)(<node b="">)</node></node></options>

name	meaning	
lineAngle	angle of the intermediate line segment. Default is 0, which is the same	
	than using \ncdiag without the lineAngle option.	

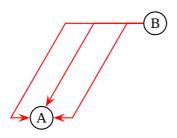

```
\begin{pspicture}(5,6)
 \circlenode{A}{A}\quad\circlenode{C}{C}%
  \quad\circlenode{E}{E}
 \rput(0,4){\circlenode{B}{B}}
 \rput(1,5){\circlenode{D}{D}}
 \rule (2,6) {\circlenode{F}{F}}
 \psset{arrowscale=2,linearc=0.2,%
  linecolor=red,armA=0.5, angleA=90,angleB
    =-90
 \ncdiag[lineAngle=20]{->}{A}{B}
 \ncput*[nrot=:U]{line I}
 \ncdiag[lineAngle=20]{->}{C}{D}
 \ncput*[nrot=:U]{line II}
 \ncdiag[lineAngle=20]{->}{E}{F}
 \ncput*[nrot=:U]{line III}
end{pspicture}
```

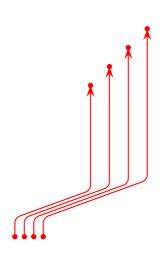

The \ncdiag macro sets the armB dynamically to the calculated value. Any user setting of armB is overwritten by the macro. The armA could be set to a zero length:

```
begin{pspicture}(4,3)
rput(0.5,0.5){\circlenode{A}{A}}
rput(3.5,3){\circlenode{B}{B}}
{\psset{linecolor=red,arrows=<-,arrowscale=2}}
ncdiag[lineAngle=60,%
armA=0,angleA=0,angleB=180]{A}{B}
ncdiag[lineAngle=60,%
armA=0,angleA=90,angleB=180]{A}{B}}
end{pspicture}</pre>
```

```
begin{pspicture}(4,3)
   \rput(1,0.5){\circlenode{A}{A}}
   \rput(4,3){\circlenode{B}{B}}
   {\psset{linecolor=red,arrows=<-,arrowscale=2}}
   \ncdiag[lineAngle=60,%
        armA=0.5,angleA=0,angleB=180]{A}{B}
   \ncdiag[lineAngle=60,%
        armA=0,angleA=70,angleB=180]{A}{B}
   \ncdiag[lineAngle=60,%
        armA=0.5,angleA=180,angleB=180]{A}{B}}
   \ncdiag[lineAngle=60,%
        armA=0.5,angleA=180,angleB=180]{A}{B}}
</pre>
```

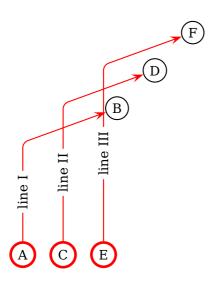

```
\begin{pspicture}(4,5.5)
              \cnode*(0,0){2pt}{A}%
              \cnode*(0.25,0){2pt}{C}%
              \color= \col
              \color= (0.75,0){2pt}{G}%
              \colone{2,4}{2pt}{B}%
              \color= \col
              \cnode*(3,5){2pt}{F}%
              \color= (3.5,5.5){2pt}{H}%
              {\psset{arrowscale=2,linearc=0.2,%
                            linecolor=red,armA=0.5, angleA=90,angleB=-90}
             \pcdiag[lineAngle=20]{->}(A)(B)
              \pcdiag[lineAngle=20]{->}(C)(D)
              \pcdiag[lineAngle=20]{->}(E)(F)
              \pcdiag[lineAngle=20]{->}(G)(H)}
        end{pspicture}
```

17. \ncdiagg and \pcdiagg

This is nearly the same as \ncdiag except that armB=0 and the angleB value is computed by the macro, so that the line ends at the node with an angle like a \pcdiagg line. The syntax of \ncdiagg/\pcdiagg is

```
\ncdiag[<options>]{<Node A>}{<Node B>}
\pcdiag[<options>](<Node A>)(<Node B>)
```

```
\begin{pspicture}(4,6)
 \psset{linecolor=black}
 \circlenode{A}{A}%
 \quad\circlenode{C}{C}%
 \quad\circlenode{E}{E}
 \rput(0,4){\circlenode{B}{B}}
 \rput(1,5){\circlenode{D}{D}}
 \rput(2,6){\circlenode{F}{F}}}
 {\psset{arrowscale=2,linearc=0.2,linecolor=red}
   ,armA=0.5, angleA=90}
 \ncdiagg[lineAngle=-160]{->}{A}{B}
 \ncput*[nrot=:U]{line I}
 \ncdiagg[lineAngle=-160]{->}{C}{D}
 \ncput*[nrot=:U]{line II}
 \ncdiagg[lineAngle=-160]{->}{E}{F}
 \ncput*[nrot=:U]{line III}}
\end{pspicture}
```

18. \ncbarr 52

```
\begin{pspicture}(4,6)
                        \psset{linecolor=black}
                        \colone{0,0}{2pt}{A}%
                     \color= \col
                     \color= \col
                     \color= \col
                     \conode*(2,4){2pt}{B}%
                     \color= \col
                     \color= (3,5){2pt}{F}%
                        \color= (3.5,5.5){2pt}{H}%
                        {\psset{arrowscale=2,linearc=0.2,linecolor=red
                                                                ,armA=0.5, angleA=90}
                     \pcdiagg[lineAngle=20]{->}(A)(B)
                     \pcdiagg[lineAngle=20]{->}(C)(D)
                        \pcdiagg[lineAngle=20]{->}(E)(F)
                     \pcdiagg[lineAngle=20]{->}(G)(H)}
             end{pspicture}
```

The only catch for $\$ ncdiagg is that you need the right value for lineAngle. If the node connection is on the wrong side of the second node, then choose the corresponding angle, e. g.: if 20 is wrong then take -160, which differs by 180.

```
\begin{pspicture}(4,1.5)
        \circlenode{a}{A}
        \rput[l](3,1){\rnode{b}{H}}
Η
        \ncdiagg[lineAngle=60,angleA=180,armA=.5,nodesepA=3
          pt,linecolor=blue]{b}{a}
       \end{pspicture}
      \begin{pspicture}(4,1.5)
        \circlenode{a}{A}
        \rput[l](3,1){\rnode{b}{H}}
        \ncdiagg[lineAngle=60,armA=.5,nodesepB=3pt,
          linecolor=blue]{a}{b}
       \end{pspicture}
      \begin{pspicture}(4,1.5)
        \circlenode{a}{A}
        \rput[l](3,1){\rnode{b}{H}}
Η
        \ncdiagg[lineAngle=-120,armA=.5,nodesepB=3pt,
          linecolor=blue]{a}{b}
       end{pspicture}
```

18. \ncbarr

This has the same behaviour as \ncbar, but has 5 segments and all are horizontal ones. This is the reason why angleA must be 0 or alternatively 180. All other values are set to 0 by the macro. The intermediate horizontal line is symmetrical to the distance of the two nodes.

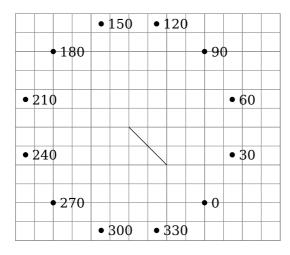

19. \psRelNode and \psDefPSPNodes

With these macros it is possible to put a node relative to a given line or given pspicture-environment. In the frist case the parameters are the angle and the length factor:

```
\psRelNode(<P0>)(<P1>){<length factor>}{<end node name>}
\psRelLine[<options>](<P0>)(<P1>){<length factor>}{<end node name>}
```

The length factor relates to the distance $\overline{P_0P_1}$ and the end node name must be a valid nodename and shouldn't contain any of the special PostScript characters. There are two valid options:

name	default	meaning
angle	angle between the given line $\overline{P_0P_1}$ and the new one $\overline{P_0P_{en}}$	
trueAngle	false	defines whether the angle refers to the seen line or to the
		mathematical one, which respect the scaling factors xunit and
		yunit.

```
begin{pspicture}(7,6)

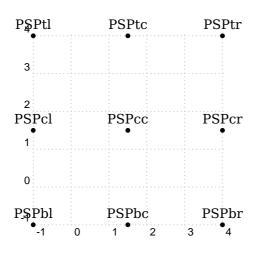

psgrid[gridwidth=0pt,gridcolor=
    gray,gridlabels=0pt,subgriddiv=2]

pnode(3,3){A}\pnode(4,2){B}

psline[nodesep=-3,linewidth=0.5pt
    ](A)(B)

multido{\iA=0+30}{12}{%
    \psRelNode[angle=\iA](A)(B){2}{C}%
    \qdisk(C){2pt}
    \uput[0](C){\iA}}
end{pspicture}
```

In the second case the new macro \psDefPSPNodes defines nine nodes that corresponds to nine particular points (namely bottom left, bottom center, bottom right, center left, center center, center right, top left, top center, top right) of the pspicture box.

The name of the nodes are predefined as:

```
\psset[pst-PSPNodes]{blName=PSPbl,bcName=PSPbc,brName=PSPbr,
    clName=PSPcl,ccName=PSPcc,crName=PSPcr,tlName=PSPtl,tcName=PSPtc,trName=PSPtr
}
```

and can be modified in the same way.

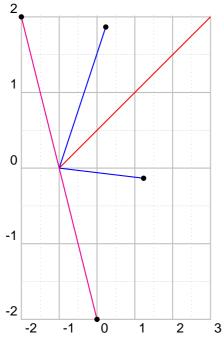

20. \psRelLine

With this macro it is possible to plot lines relative to a given one. Parameter are the angle and the length factor:

```
\label{line} $$ \psRelLine(P0)(P1)_{length\ factor}_{cond node\ name} $$ \psRelLine[arrows](P0)(P1)_{length\ factor}_{end\ node\ name} $$ \psRelLine[Options](P0)(P1)_{length\ factor}_{end\ node\ name} $$ \psRelLine[Options](P0)(P1)_{length\ factor}_{end\ node\ name} $$ $$ \psRelLine[Options](P0)(P1)_{end\ name}_{end\ node\ name} $$ \psRelLine[Options](P0)(P1)_{end\ name}_{end\ node\ node\ name}_{end\ node\ node\ node\ name}_{end\ node\ node\ node\ node\ node\ node\
```

The length factor relates to the distance $\overline{P_0P_1}$ and the end node name must be a valid nodename and shouldn't contain any of the special PostScript characters. There are two valid options which are described in the foregoing section for \psRelNode.

The following two figures show the same, the first one with a scaling different to 1:1, this is the reason why the end points are on an ellipse and not on a circle like in the second figure.

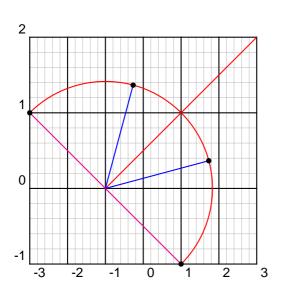

```
\psset{yunit=2,xunit=1}
\begin{array}{l} \mathbf{begin} \{ pspicture \} (-2, -2) (3, 2) \end{array}
\psgrid[subgriddiv=2,subgriddots=10,gridcolor=
  lightgray]
\pole(-1,0){A}\pole(3,2){B}
\psline[linecolor=red](A)(B)
\psRelLine[linecolor=blue,angle=30](-1,0)(B)
  {0.5}{EndNode}
\qdisk(EndNode){2pt}
\psRelLine[linecolor=blue,angle=-30](A)(B)
  {0.5}{EndNode}
\qdisk(EndNode){2pt}
\psRelLine[linecolor=magenta,angle=90](-1,0)
  (3,2)\{0.5\}\{EndNode\}
\qdisk(EndNode){2pt}
\psRelLine[linecolor=magenta,angle=-90](A)(B)
  {0.5}{EndNode}
\qdisk(EndNode){2pt}
\end{pspicture}
```

```
1 0 1 2
```

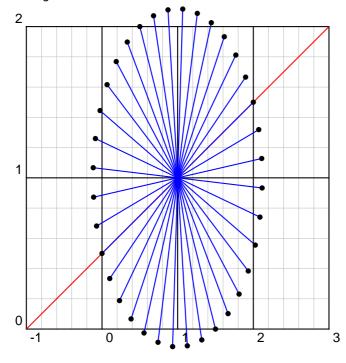

```
\begin{array}{c} \begin{array}{c} \mathbf{begin} \{ pspicture \} (-2, -2) (3, 2) \end{array} \end{array}
\psgrid[subgriddiv=2,subgriddots=10,gridcolor=
          lightgray]
\pnode(-1,0){A}\pnode(3,2){B}
\psline[linecolor=red](A)(B)
\prootember \pro
\psRelLine[linecolor=blue,angle=30](-1,0)(B)
          {0.5}{EndNode}
  \qdisk(EndNode){2pt}
  \psRelLine[linecolor=blue,angle=-30](A)(B)
          {0.5}{EndNode}
 \qdisk(EndNode){2pt}
\psRelLine[linecolor=magenta,angle=90](-1,0)
          (3,2)\{0.5\}\{EndNode\}
\qdisk(EndNode){2pt}
  \psRelLine[linecolor=magenta,angle=-90](A)(B)
          {0.5}{EndNode}
  \qdisk(EndNode){2pt}
   \end{pspicture}
```

The following figure has also a different scaling, but has set the option trueAngle, all angles refer to "what you see".

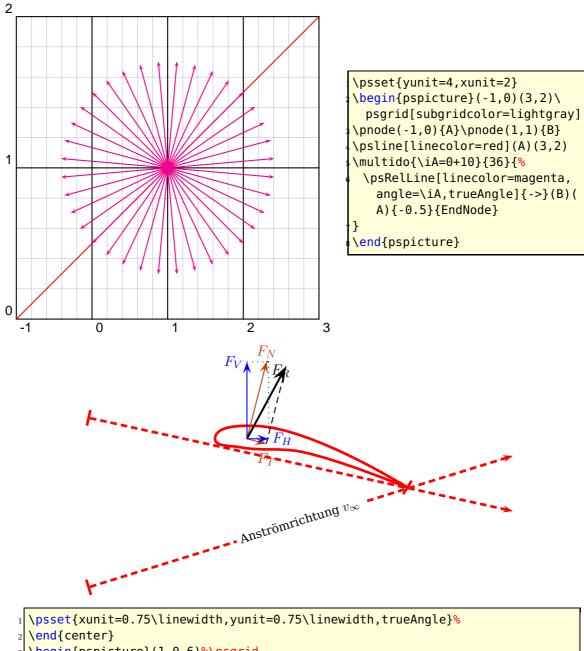

```
\psset{yunit=2,xunit=1}
 \begin{pspicture}(-3,-1)(3,2)\psgrid[
   subgridcolor=lightgray]
 \pnode(-1,0){A}\pnode(3,2){B}
 \psline[linecolor=red](A)(B)
 \psarc(A){2.83}{-45}{135}
 \psRelLine[linecolor=blue,angle=30,
   trueAngle](A)(B){0.5}{EndNode}
 \qdisk(EndNode){2pt}
 \psRelLine[linecolor=blue,angle=-30,
   trueAngle](A)(B){0.5}{EndNode}
 \qdisk(EndNode){2pt}
10 \psRelLine[linecolor=magenta,angle=90,
   trueAngle](A)(B){0.5}{EndNode}
 \qdisk(EndNode){2pt}
 \psRelLine[linecolor=magenta,angle=-90,
   trueAngle](A)(B){0.5}{EndNode}
 \qdisk(EndNode){2pt}
 \end{pspicture}
```

Two examples using \multido to show the behaviour of the options trueAngle and angle.

```
\psset{yunit=4,xunit=2}
\begin{pspicture}(-1,0)(3,2)\
   psgrid[subgridcolor=lightgray]
\pnode(-1,0){A}\pnode(1,1){B}
\psline[linecolor=red](A)(3,2)
\multido{\iA=0+10}{36}{%
  \psRelLine[linecolor=blue,
     angle=\iA](B)(A){-0.5}{
    EndNode}
  \qdisk(EndNode){2pt}

}
\end{pspicture}
```

```
| \psset{xunit=0.75\linewidth,yunit=0.75\linewidth,trueAngle}%
| \quad \
```

```
14
   \psParallelLine[linestyle=dashed](D)(FtE)(Fn){.1}{Fnr1}
    \psRelLine[linestyle=dashed,angle=90](FtE)(D){-4}{Fnr2} % why "-4"?
15
   \psline[linewidth=1.5pt,arrows=->,arrowscale=2](D)(Fnr2)
16
   \psIntersectionPoint(D)([nodesep=2]D)(Fnr1)([offset=-4]Fnr1){Fh}
   \psIntersectionPoint(D)([offset=2]D)(Fnr1)([nodesep=4]Fnr1){Fv}
   \psline[linecolor=blue,arrows=->,arrowscale=2](D)(Fh)
19
   \psline[linecolor=blue,arrows=->,arrowscale=2](D)(Fv)
20
   \psline[linestyle=dotted](Fh)(Fnr1) \psline[linestyle=dotted](Fv)(Fnr1)
   \begin{array}{ll} & \sup_{1,1} [0](Fh)_{\left( s_{-1} \right)} & \sup_{1,1} [180](Fv)_{\left( s_{-1} \right)} \end{array}
22
   \t = 1_{-45}(Fnr1)_{F_{R}} \t = 1_{-90}(Fn)_{\color_{red}.75!green}_{N}
23
   \uput{.25}[-90](FtE){\color{red!75!green}$F_{T}$}
25 \end{pspicture}
```

21. \psParallelLine

With this macro it is possible to plot lines relative to a given one, which is parallel. There is no special parameter here.

```
\psParallelLine(<P0>)(<P1>)(<P2>){<length>}{<end node name>}
\psParallelLine{<arrows>}(<P0>)(<P1>)(<P2>){<length>}{<end node name>}
\psParallelLine[<options>](<P0>)(<P1>)(<P2>){<length>}{<end node name>}
\psParallelLine[<options>]{<arrows>}(<P0>)(<P1>)(<P1>)(<P2>){<length>}{<end node name>}
\name>}
```

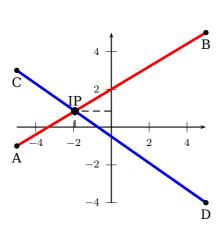

The line starts at P_2 , is parallel to $\overline{P_0P_1}$ and the length of this parallel line depends on the length factor. The end node name must be a valid nodename and shouldn't contain any of the special PostScript characters.

```
\begin{pspicture*}(-5,-4)(5,3.5)
 \psgrid[subgriddiv=0,griddots=5]
 \poline{2,-2}{FF}\qdisk(FF){1.5pt}
 \pole(-5,5){A}\pole(0,0){0}
 \multido{\nCountA=-2.4+0.4}{9}{%
  \psParallelLine[linecolor=red](
    0)(A)(0,\nCountA){9}{P1}
  \psline[linecolor=red](0,\
    nCountA)(FF)
  \psRelLine[linecolor=red](0,\
    nCountA)(FF){9}{P2}
 \psline[linecolor=blue](A)(FF)
 \psRelLine[linecolor=blue](A)(FF)
   {5}{END1}
 \psline[linewidth=2pt,arrows
   =->](2,0)(FF)
end{pspicture*}
```

22. \psIntersectionPoint

This macro calculates the intersection point of two lines, given by the four coordinates. There is no special parameter here.

 $\proonup (<P0>) (<P1>) (<P2>) (<P3>) {<node name>}$

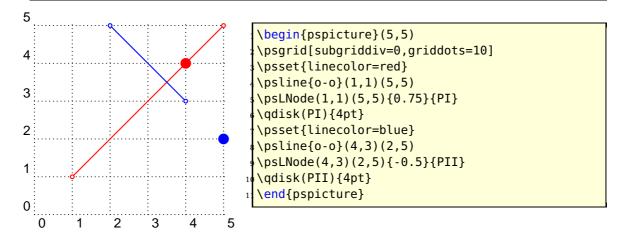

```
\psset{unit=0.5cm}
\begin{array}{c} \begin{array}{c} \mathbf{begin} \{ pspicture \} (-5, -4) (5, 5) \end{array} \end{array}
 \psaxes[labelFontSize=\scriptstyle,
   dx=2,Dx=2,dy=2,Dy=2]\{->\}(0,0)(-5,-4)(5,5)
 \psline[linecolor=red,linewidth=2pt](-5,-1)
    (5,5)
 \psline[linecolor=blue,linewidth=2pt](-5,3)
   (5, -4)
 \disk(-5,-1){2pt}\int_{-90}(-5,-1){A}
 \disk(5,5){2pt}\displaystyle [-90](5,5){B}
 \disk(-5,3){2pt}\uput[-90](-5,3){C}
 \disk(5,-4){2pt}\uput[-90](5,-4){D}
 \protectionPoint(-5,-1)(5,5)(-5,3)
    (5,-4){IP}
 \qdisk(IP){3pt}\uput{0.3}[90](IP){IP}
 \psline[linestyle=dashed](IP|0,0)(IP)(0,0|
   IP)
end{pspicture}
```

23. \psLNode and \psLCNode

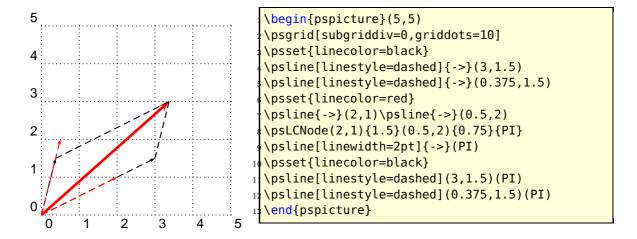

\psLNode interpolates the Line \overline{AB} by the given value and sets a node at this point. The syntax is

\psLNode(P1)(P2){value}{Node name}

The \psLCNode macro builds the linear combination of the two given vectors and stores the end of the new vector as a node. All vectors start at (0,0), so a \rput maybe appropriate. The syntax is

\psLCNode(P1){value 1}(P2){value 2}{Node name}

24. \nlput and \psLDNode

\ncput allows you to set a label relative to the first node of the last node connection. With \nlput this can be done absolute to a given node. The syntax is different to the other node connection macros. It uses internally the macro \psLDNode which places a node absolute to two given points, starting from the first one.

```
\nlput[options](A)(B){distance}{text}
\psLDNode[options](A)(B){distance}{node name}
```

```
Fost Fost Fost
```

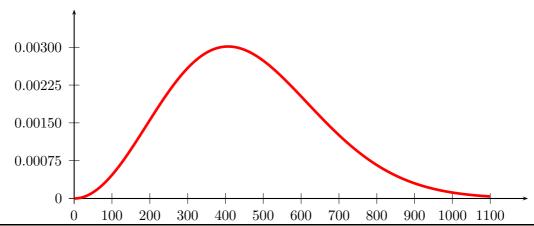

25. New syntax 62

Part III. pst-plot

25. New syntax

There is now a new optional argument for \psplot and \parametricplot to pass additional PostScript commands into the code. This makes the use of \pstVerb in most cases superfluous.

```
\psplot [Options] \{x0\}\{x1\} [PS commands] \{function\} \parametricplot [Options] \{t0\}\{t1\} [PS commands] \{x(t)\ y(t)\}
```

```
begin{pspicture}(0,-0.5)(12,5)

psaxes[Dx=100,dx=1,Dy=0.00075,dy=1]{->}(0,0)(12,5)

psplot[linecolor=red, plotstyle=curve,linewidth=2pt,plotpoints=200]{0}{11}%

[ /const1 3.3 10 8 neg exp mul def /s 10 def /const2 6.04 10 6 neg exp mul def ]%

{ const1 x 100 mul dup mul mul Euler const2 neg x 100 mul dup mul mul exp mul 2000 mul}

end{pspicture}
```

26. New or extended options

The axes macro has now two additional optional arguments for placing labels at the end of the axes:

```
\psaxes[settings]{arrows}(x0,y0)(x1,y1)(x2,y2)[Xlabel,Xangle][Ylabel,Yangle]
```

It has now four optional arguments, one for the setting, one for the arrows, one for the x-label and one for the y-label. If you want only a y-label, then leave the x one empty. A missing y-label is possible. The following examples show how it can be used.

The option tickstyle=full |top|bottom no longer works in the usual way. Only the additional value inner is valid for pstricks-add, because everything can be set by the ticksize option. When using the comma or trigLabels option, the macros \pshlabel and \psvlabel shouldn't be redefined, because the package does it itself internally

in these cases. However, if you need a redefinition, then do it for <page-header> and $\$ with

```
\makeatletter
\def\ps@@hlabel#1{...}
\def\ps@@vlabel#1{...}
\makeatother
```

Table 2: All new parameters for pst-plot

26.1. axesstyle **65**

26.1. axesstyle

There is a new axes style polar which plots a polar coordinate system. Syntax:

```
\psplot[axesstyle=polar](Rx,Ry)
\psplot[axesstyle=polar](...)(Rx,Ry)
\psplot[axesstyle=polar](...)(Rx,Ry)
```

Important is the fact, that only one pair of coordinates is taken into account for the radius. It is *always* the last pair in a sequence of allowed coordinates for the \psaxes macro. The other ones are ignored; they are not valid for the polar coordinate system.

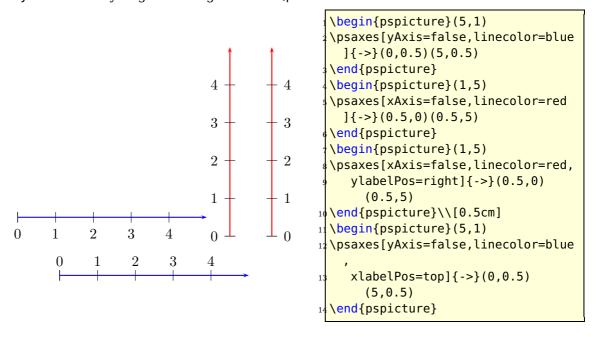

All valid optional arguments for the axes are also possible for the polar style, if they make sense ...:) Important are the Dy option, it defines the angle interval and subticks, for the intermediate circles and lines. The number can be different for the circles (ysubticks) and the lines (xsubticks).

26.2. xyAxes, xAxis and yAxis

Syntax:

```
xyAxes=true|false
xAxis=true|false
yAxis=true|false
```

Sometimes there is only a need for one axis with ticks. In this case you can set one of the preceding options to false. The xyAxes only makes sense when you want to set both x and y to true with only one command, back to the default, because with xyAxes=falseyou get nothing with the \psaxes macro.

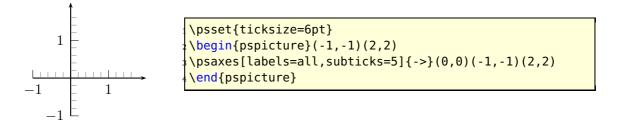

As seen in the example, a single y axis gets the labels on the left side. This can be changed with the option ylabelPos or with xlabelPos for the x-axis.

26.3. labels

Syntax:

labels=all|x|y|none

This option is also already in the pst-plot package and only mentioned here for completeness.

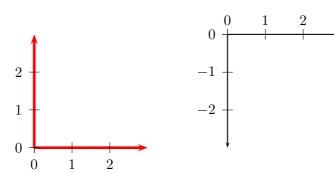

26.4. xlabelPos and ylabelPos

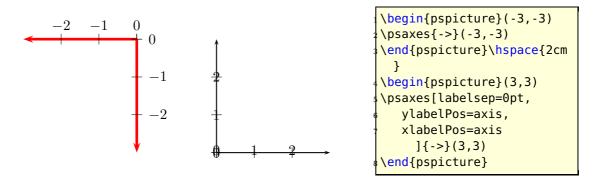

Syntax:

```
xlabelPos=bottom|axis|top
ylabelPos=left|axis|right
```

By default the labels for ticks are placed at the bottom (x axis) and left (y-axis). If both axes are drawn in the negative direction the default is top (x axis) and right (y axis). It be changed with the two options xlabelPos and ylabelPos. With the value axis the user can place the labels depending on the value of labelsep, which is taken into account for axis.

```
t \begin{pspicture}(3,3)
2 \psaxes{->}(3,3)
3 \end{pspicture}\hspace{2cm}
}
4 \begin{pspicture}(3,-3)
5 \psaxes[xlabelPos=top]{->}(3,-3)
6 \end{pspicture}
```

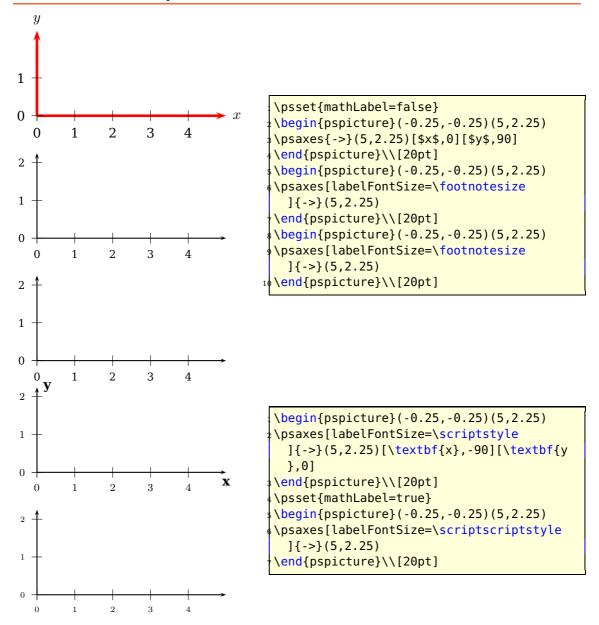

26.5. Changing the label font size with labelFontSize and mathLabel

This option sets the horizontal **and** vertical font size for the labels depending on the option mathLabel for the text or the math mode. It will be overwritten when another package or a user defines

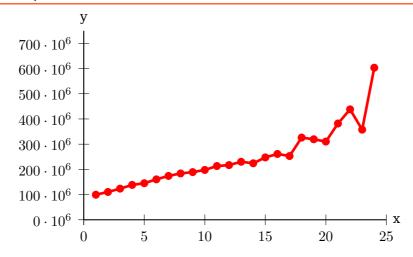

```
\def\pshlabel#1{\labelFontSize ...}
\def\psvlabel#1{\labelFontSize ...}
\def\pshlabel#1{$\labelFontSize ...$}% for mathLabel=true (default)
\def\psvlabel#1{$\labelFontSize ...$}% for mathLabel=true (default)
```

in another way. Note that for mathLabel=truethe font size must be set by one of the mathematical styles \textstyle, \displaystyle, \scriptstyle, or \scriptscriptstyle.

26.6. xlabelFactor and ylabelFactor

When having big numbers as data records then it makes sense to write the values as $< number > \cdot 10^{< exp>}$. These new options allow you to define the additional part of the value, but it must be set in math mode when using math operators!

```
\readdata{\data}{demo1.data}

\pstScalePoints(1,0.000001){}{}% (x,y){additional x operator}{y op}

\psset{llx=-1cm,lly=-1cm}

\psgraph[ylabelFactor=\cdot 10^6,Dx=5,Dy=100](0,0)(25,750){8cm}{5cm}

\listplot[linecolor=red, linewidth=2pt, showpoints=true]{\data}

\endpsgraph

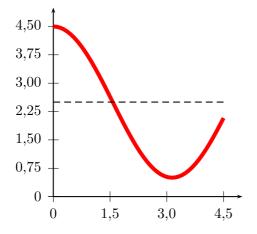

\pstScalePoints(1,1){}{}% reset
```

26.7. decimalSeparator and comma

Syntax:

```
comma=false|true
decimalSeparator=<charactor>
```

Setting the option comma to true gives labels with a comma as a decimal separator instead of the dot. comma and comma=true is the same. The optional argument decimalSeparator allows an individual setting for languages with a different character than a dot or a comma. The character has to set into braces, if it is an active, e.g. decimalSeparator={,}.

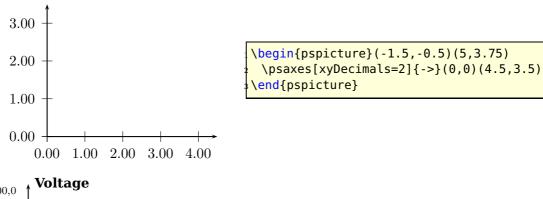

```
\begin{pspicture}(-0.5,-0.5)(5,5.5)
\psaxes[Dx=1.5,comma,Dy=0.75,dy
=0.75]{->}(5,5)
\psplot[linecolor=red,linewidth=3pt]{0}{4.5}%
    {x RadtoDeg cos 2 mul 2.5 add}
\psline[linestyle=dashed](0,2.5)(4.5,2.5)
\end{pspicture}
```

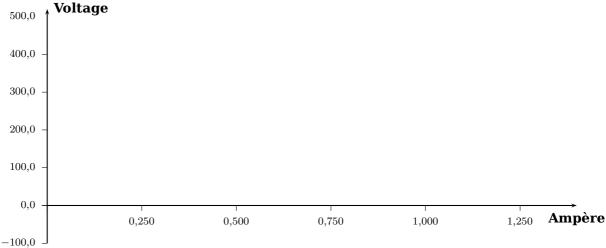

26.8. xyDecimals, xDecimals and yDecimals

Syntax:

```
xyDecimals=<number>
xDecimals=<any>
yDecimals=<any>
```

By default the labels of the axes get numbers with or without decimals, depending on the numbers. With these options ??Decimals it is possible to determine the decimals, where the option xyDecimals sets this identical for both axes. The default setting {} means, that you'll get the standard behaviour.

```
\psset{xunit=10cm,yunit=0.01cm,labelFontSize=\scriptstyle}
\begin{pspicture}(-0.1,-150)(1.5,550.0)
\psaxes[Dx=0.25,Dy=100,ticksize=-4pt 0,comma=true,xDecimals=3,yDecimals
=1]{->}%
(0,0)(0,-100)(1.4,520)[\textbf{Amp\'ere},-90][\textbf{Voltage},0]
\end{pspicture}
```

26.9. trigLabels and trigLabelBase - axis with trigonmetrical units

With the option trigLabels=true the labels on the x axis are trigonometrical ones. The option trigLabelBase set the denominator of fraction. The default value of 0 is the same as no fraction. The following constants are defined in the package:

```
\def\psPiFour\{12.566371\}
\def\psPiTwo\{6.283185\}
\def\psPi\{3.14159265\}
\def\psPiH\{1.570796327\}
\newdimen\pstRadUnit
\newdimen\pstRadUnitInv
\pstRadUnit=1.047198cm % this is pi/3
\pstRadUnitInv=0.95493cm % this is 3/pi
```

Because it is a bit complicated to set the right values, we show some more examples here.

For **all** following examples in this section we did a global \psset{trigLabels=true,labelFontSize=\scriptstyle}.

Translating the decimal ticks to trigonometrical ones makes no real sense, because every 1 xunit (1cm) is a tick and the last one is at 6cm.

```
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)%
                                                     \poonup(5,0){A}%
                                                    psaxes{->}(0,0)(-.5,-1.25)(psPiTwo,1.25)
                2\pi
                      3\pi
                            4\pi
                                                   \end{pspicture}
-1
 1
                                                   \begin{pspicture}(-0.5,-1.25)(6.5,1.25)%
                                                    \psaxes[trigLabelBase=3]{->}(0,0)(-0.5,-1.25)
                                                       (\psPiTwo,1.25)
                \frac{2\pi}{3}
                            \frac{4\pi}{3}
                                         2\pi
                                                   \end{pspicture}
-1 -
```

Modifying the ticks to have the last one exactly at the end is possible with a different dx value ($\frac{\pi}{3} \approx 1.047$):

```
1 \begin{pspicture}(-0.5,-1.25)(6.5,1.25)\pnode
        (\psPiTwo,0){C}%
2 \psaxes[dx=\pstRadUnit]{->}(0,0)(-0.5,-1.25)
        (\psPiTwo,1.25)
3 \end{pspicture}%
```

```
1 \begin{pspicture}(-0.5,-1.25)(6.5,1.25)\pnode
        (5,0){B}%
2 \psaxes[dx=\pstRadUnit,\trigLabelBase=3]
        {->}(0,0)(-0.5,-1.25)(\psPiTwo,1.25)
3 \end{pspicture}%
```

Set everything globally in radian units. Now 6 units on the x-axis are 6π . Using trigLabelBase=3 reduces this value to 2π , a.s.o.

```
1 1
                                    2\pi
                                                   3\pi
                                                                  4\pi
                                                                                5\pi
                                                                                               6\pi
-1
  1
                                     \frac{2\pi}{3}
                                                                  \frac{4\pi}{3}
                                                                                 \frac{5\pi}{3}
                                                                                               2\pi
 -1
  1
-1
  1
-1 +
```

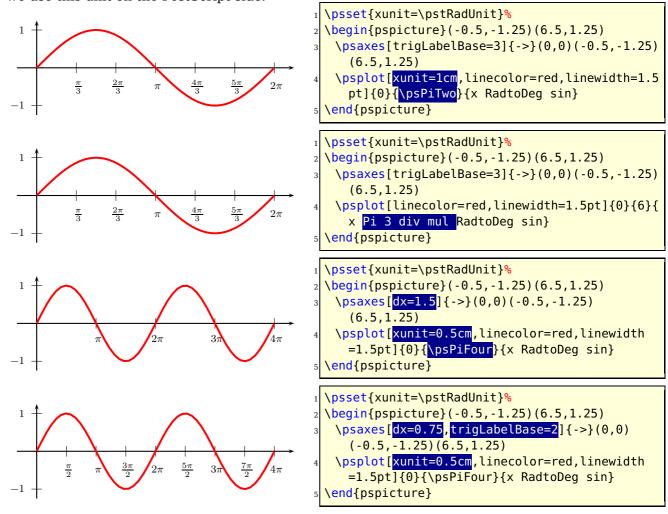

```
1 \psset{xunit=\pstRadUnit}%
2 \begin{pspicture}(-0.5,-1.25)(6.5,1.25)\pnode
      (6,0){D}%
3 \psaxes{->}(0,0)(-0.5,-1.25)(6.5,1.25)%
4 \end{pspicture}%
```

```
1 \psset{xunit=\pstRadUnit}%
2 \begin{pspicture}(-0.5,-1.25)(6.5,1.25)
3 \psaxes[trigLabelBase=3]{->}(0,0)(-0.5,-1.25)(6.5,1.25)
4 \end{pspicture}%
```

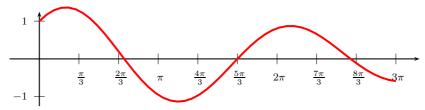

```
1 \psset{xunit=\pstRadUnit}%
2 \begin{pspicture}(-0.5,-1.25)(6.5,1.25)
3 \psaxes[trigLabelBase=4]{->}(0,0)(-0.5,-1.25)(6.5,1.25)
4 \end{pspicture}%
```

```
1 \psset{xunit=\pstRadUnit}%
2 \begin{pspicture}(-0.5,-1.25)(6.5,1.25)
3 \psaxes[trigLabelBase=6]{->}(0,0)(-0.5,-1.25)(6.5,1.25)
4 \end{pspicture}%
```

The best way seems to be to set the x-unit to \pstRadUnit. Plotting a function doesn't consider the value for trigLabelBase, it has to be done by the user. The first example sets the unit locally for the \psplot back to 1cm, which is needed, because we use this unit on the PostScript side.

It is also possible to set the x unit and dx value to get the labels right. But this needs some more understanding as to how it really works. A xunit=1.570796327 sets the unit to $\pi/2$ and a dx=0.666667 then puts at every 2/3 of the unit a tick mark and a label. The length of the x-axis is 6.4 units which is $6.4 \cdot 1.570796327cm \approx 10cm$. The function then is plotted from 0 to $3\pi = 9.424777961$.

```
\begin{pspicture}(-0.5,-1.25)(10,1.25)

\psaxes[xunit=\psPiH,trigLabelBase=3,dx=0.666667]{->}(0,0)(-0.5,-1.25)

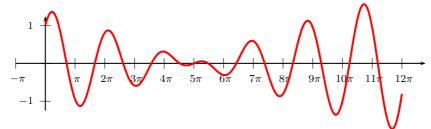

(6.4,1.25)
```

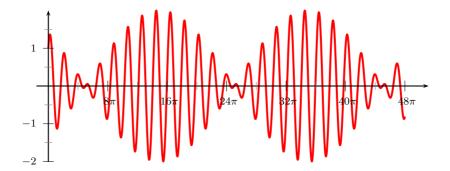

```
\psplot[linecolor=red,linewidth=1.5pt]{0}{9.424777961}{%

x RadtoDeg dup sin exch 1.1 mul cos add}

tend{pspicture}

\[ \text{psplot[linecolor=red,linewidth=1.5pt]} \text{ \text{end} \text{end} \text{ \text{end} \text{ \text{end} \text{ \text{end} \text{end} \text{ \text{end} \text{ \text{end} \text{ \text{end} \text{ \text{end} \text{end} \text{end} \text{ \text{end} \text
```

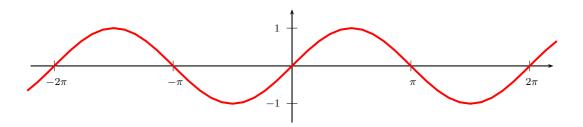

```
psset{unit=1cm}
begin{pspicture}(-0.5,-1.25)(10,1.25)

psplot[xunit=0.0625,linecolor=red,linewidth=1.5pt,%
plotpoints=5000]{0}{150.80}%

{x RadtoDeg dup sin exch 1.1 mul cos add}

psaxes[xunit=\psPi,dx=0.5,Dx=8]{->}(0,0)(-0.25,-1.25)(3.2,1.25)

end{pspicture}
```

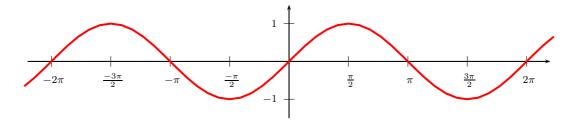

```
begin{pspicture}(-7,-1.5)(7,1.5)

psaxes[trigLabels=true,xunit=\psPi]{->}(0,0)(-2.2,-1.5)(2.2,1.5)

psplot[linecolor=red,linewidth=1.5pt]{-7}{7}{x RadtoDeg sin}

end{pspicture}
```

26.10. ticks **76**

```
begin{pspicture}(-7,-1.5)(7,1.5)

psaxes[trigLabels=true,

trigLabelBase=2,dx=\psPiH,xunit=\psPi]{->}(0,0)(-2.2,-1.5)(2.2,1.5)

psplot[linecolor=red,linewidth=1.5pt]{-7}{7}{x RadtoDeg sin}

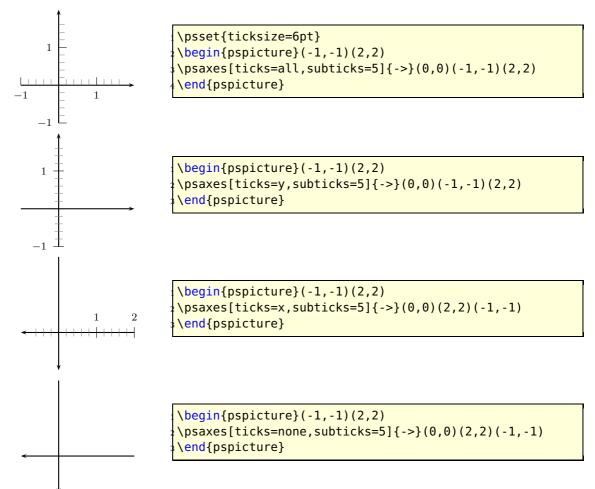

end{pspicture}
```

26.10. ticks

Syntax:

ticks=all|x|y|none

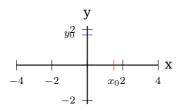

This option is also already in the pst-plot package and only mentioned here for some completeness.

26.11. tickstyle **77**

Single ticks with labels can be set with the two macros \psxTick and \psyTick:

```
\psxTick[options](x value){label}
\psyTick[options](y value){label}
```

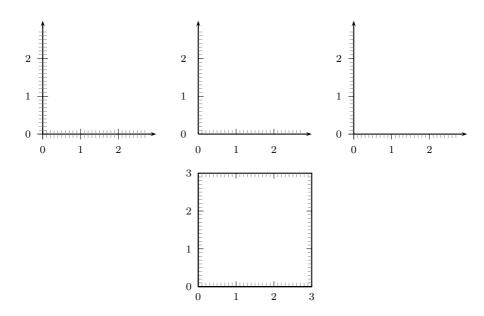

```
begin{psgraph}[Dx=2,Dy=2](0,0)
    (-4,-2.2)(4,2.2){.5\textwidth
    }{!}
    \psxTick[linecolor=red](1.5){x_0}
    \psyTick[linecolor=blue](1.7){y
        _0}
    \end{psgraph}
```

26.11. tickstyle

Syntax:

```
tickstyle=full|top|bottom|inner
```

The value inner (not available with the basic pstricks package) is only valid for the axes style frame.

```
\psset{subticks=10}
\begin{pspicture}(-1,-1)(3,3) \psaxes[tickstyle=full]{->}(3,3) \end{
    pspicture}
\begin{pspicture}(-1,-1)(3,3) \psaxes[tickstyle=top]{->}(3,3) \end{pspicture}
\begin{pspicture}(-1,-1)(3,3) \psaxes[tickstyle=bottom]{->}(3,3)\end{
    pspicture}
\begin{pspicture}(-1,-1)(3,3) \psaxes[axesstyle=frame, tickstyle=inner, ticksize=0 4pt]{->}(3,3)
\end{pspicture}
\end{pspicture}
```

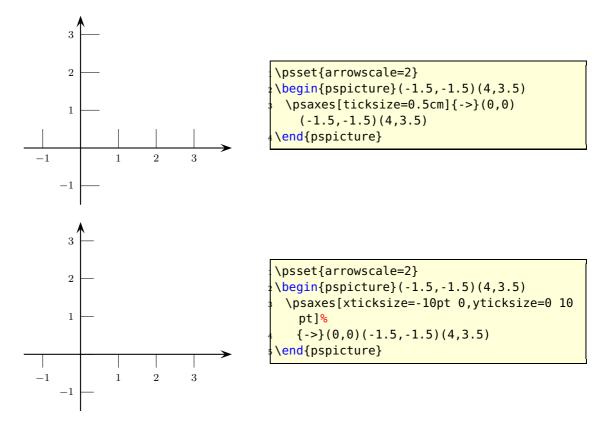

26.12. ticksize, xticksize, yticksize

With this new option the recent tickstyle option of pst-plot is obsolete and no longer supported by pstricks-add.

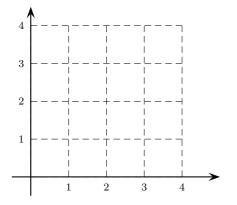

Syntax:

```
ticksize=value[unit]
ticksize=value[unit] value[unit]
xticksize=value[unit]
xticksize=value[unit] value[unit]
yticksize=value[unit]
yticksize=value[unit] value[unit]
```

ticksize sets both values. The first one is left/below and the optional second one is right/above of the coordinate axis. The old setting tickstyle=bottom is now easy to realize, e.g.: ticksize=-6pt 0, or vice versa, if the coordinates are set from positive to negative values.

A grid is also possible by setting the values to the max/min coordinates.

```
\psset{arrowscale=2}

\begin{pspicture}(-.5,-.5)(5,4.5)

\psaxes[ticklinestyle=dashed,

ticksize=0 4cm]{->}(0,0)(-.5,-.5)

(5,4.5)

\end{pspicture}
```

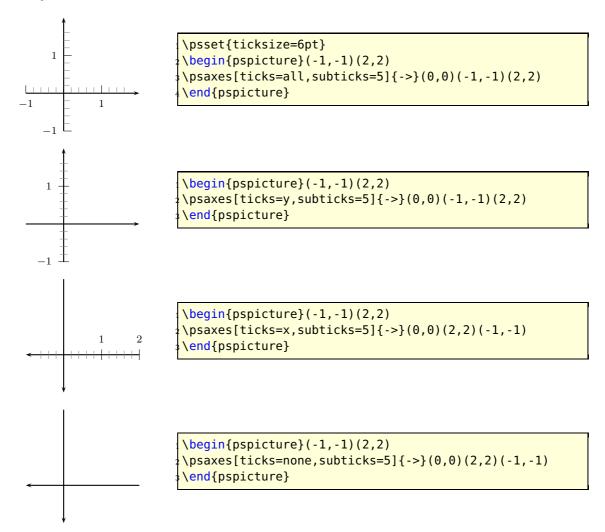

26.13. subticks **80**

26.13. subticks

Syntax:

subticks=<number>

By default subticks cannot have labels.

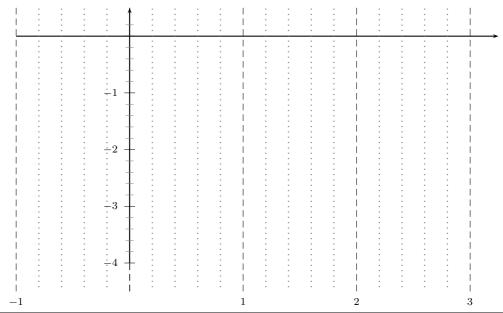

26.14. subticksize, xsubticksize, ysubticksize

Syntax:

```
subticksize=value
xsubticksize=value
ysubticksize=value
```

subticksize sets both values, which are relative to the ticksize length and can have any number. 1 sets it to the same length as the main ticks.

```
\psset{yunit=1.5cm, xunit=3cm}
\begin{pspicture}(-1.25,-4.75)(3.25,.75)
\psaxes[xticksize=-4.5 0.5, ticklinestyle=dashed, subticks=5, xsubticksize=1,

ysubticksize=0.75, xsubticklinestyle=dotted, xsubtickwidth=1pt,
subtickcolor=gray]{->}(0,0)(-1,-4)(3.25,0.5)
\end{pspicture}
```

26.15. tickcolor, subtickcolor

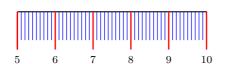

Syntax:

```
tickcolor=<color>
xtickcolor=<color>
ytickcolor=<color>
subtickcolor=<color>
xsubtickcolor=<color>
ysubtickcolor=<color>
```

tickcolor and subtickcolor set both for the x- and the y-Axis.

```
\begin{pspicture}(0,-0.75)(10,1)
\psaxes[yAxis=false,labelFontSize=\scriptstyle,ticksize=0 10mm,subticks=10,
    subticksize=0.75,
    tickcolor=red,subtickcolor=blue,tickwidth=1pt,subtickwidth=0.5pt](10.01,0)
\end{pspicture}
```

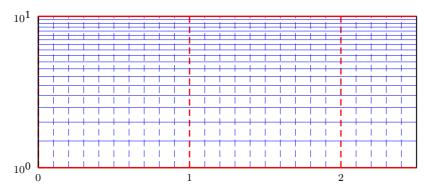

\begin{pspicture}(5,-0.75)(10,1)
\psaxes[yAxis=false,labelFontSize=\scriptstyle,
 ticksize=0 -10mm,subticks=10,subticksize=0.75,
 tickcolor=red,subtickcolor=blue,tickwidth=1pt,
 subtickwidth=0.5pt,0x=5](5,0)(5,0)(10.01,0)
\end{pspicture}

26.16. ticklinestyle and subticklinestyle

Syntax:

```
ticklinestyle=solid|dashed|dotted|none
xticklinestyle=solid|dashed|dotted|none
yticklinestyle=solid|dashed|dotted|none
subticklinestyle=solid|dashed|dotted|none
xsubticklinestyle=solid|dashed|dotted|none
ysubticklinestyle=solid|dashed|dotted|none
```

ticklinestyle and subticklinestyle set both values for the x and y axis. The value none doesn't really makes sense, because it is the same as [sub]ticklines=0

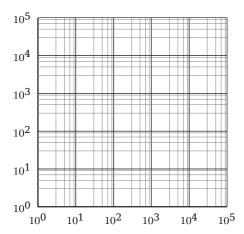

26.17. logLines

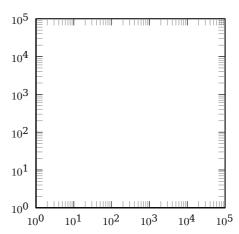

Syntax:

```
logLines = all|x|y
```

By default the option logLines sets the ticksize to the maximal length for x, y, or both. It can be changed, when *after* the option logLines the ticksize is set.

26.17. logLines **83**

```
\pspicture(-1,-1)(5,5)

\psaxes[subticks=5,xylogBase=10,logLines=all](5,5)

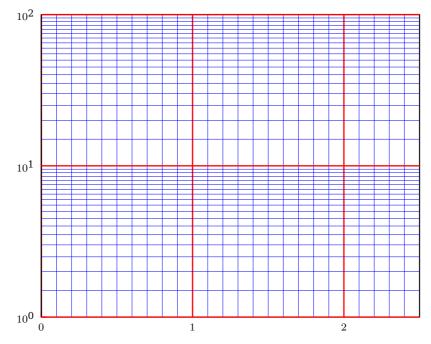

\endpspicture\hspace{1cm}

\pspicture(-1,-1)(5,5)

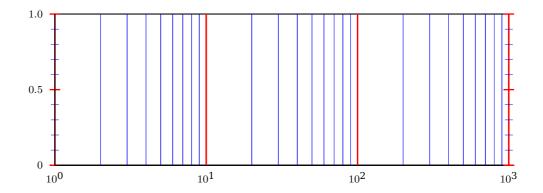

\psaxes[subticks=10,axesstyle=frame,xylogBase=10,logLines=all,ticksize=0

5pt,tickstyle=inner](5,5)

\endpspicture
```

```
\psset{unit=4cm}
\pspicture(-0.15,-0.15)(2.5,2)
\psaxes[axesstyle=frame,logLines=y,xticksize=max,xsubticksize=1,ylogBase =10,
tickcolor=red,subtickcolor=blue,tickwidth=1pt,subticks=20,xsubticks =10](2.5,2)
\endpspicture
```

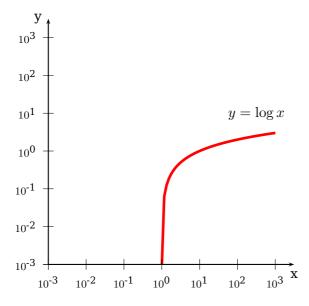

26.18. xylogBase, xlogBase and ylogBase

There are additional options xylogBase, xlogBase, ylogBase to get one or both axes with logarithmic labels. For an interval of $[10^{-3}...10^2]$ choose a pstricks interval of [-3,2]. pstricks takes 0 as the origin of this axes, which is wrong if we want to have a logarithmic axes. With the options 0y and 0x we can set the origin to -3, so that the first label gets 10^{-3} . If this is not done by the user then pstricks-add does it by default. An alternative is to set these parameters to empty values $0x=\{\},0y=\{\}$, in this case pstricks-add does nothing.

xylogBase

This mode in math is also called double logarithmic. It is a combination of the two foregoing modes and the function is now $y = \log x$ and is shown in the following example.

```
begin{pspicture}(-3.5,-3.5)(3.5,3.5)

psplot[linewidth=2pt,linecolor=red
    ]{0.001}{3}{x log}

psaxes[xylogBase=10,0y=-3,0x
    =-3]{->}(-3,-3)(3.5,3.5)

uput[-90](3.5,-3){x}

uput[180](-3,3.5){y}

rput(2.5,1){$y=\log x$}

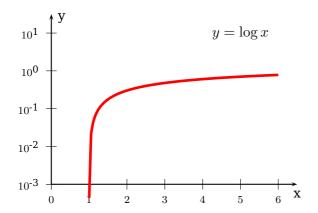

end{pspicture}
```

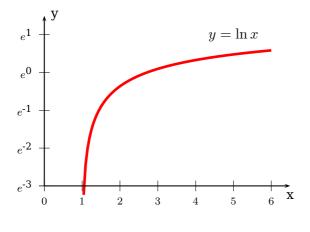

ylogBase

The values for the \psaxes y-coordinate are now the exponents to the base 10 and for the right function to the base $e\colon 10^{-3}\dots 10^1$ which corresponds to the given y-interval $-3\dots 1.5$, where only integers as exponents are possible. These logarithmic labels have no effect on the internally used units. To draw the logarithm function we have to use the math function

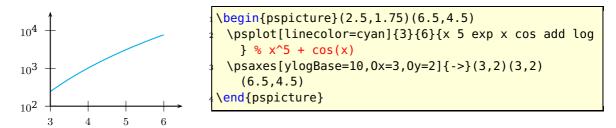

$$y = \log\{\log x\}$$
$$y = \ln\{\ln x\}$$

with an drawing interval of 1.001...6.

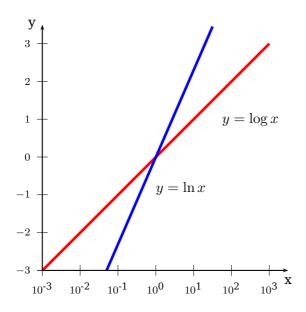

```
begin{pspicture}(-0.5,1.75)
  (6.5,4.5)
  \psaxes[ylogBase=10,0y=2]{->}(0,2)
   (0,2)(6.5,4.5)
  \end{pspicture}
```

xlogBase

Now we have to use the easy math function y = x because the x axis is still $\log x$.

```
begin{pspicture}(-3.5,-3.5)(3.5,3.5)

psplot[linewidth=2pt,linecolor=red
    ]{-3}{3}{x} % log(x)

psplot[linewidth=2pt,linecolor=
    blue]{-1.3}{1.5}{x 0.4343 div} %
    ln(x)

psaxes[xlogBase=10,0y=-3,0x
    =-3]{->}(-3,-3)(3.5,3.5)

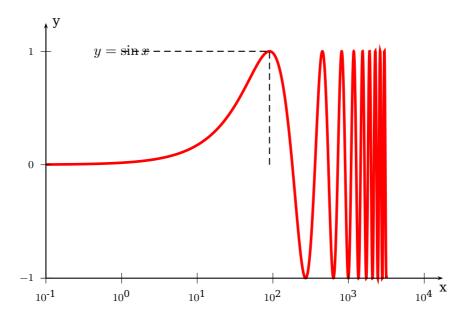

uput[-90](3.5,-3){x}

uput[180](-3,3.5){y}

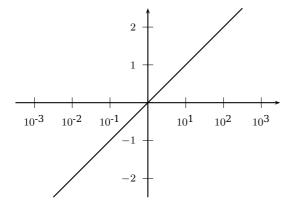

rput(2.5,1){$y=\log x$}

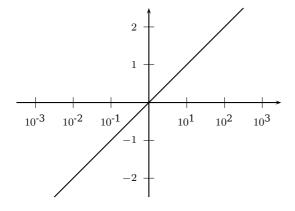

rput[lb](0,-1){$y=\ln x$}

end{pspicture}
```

\endpspicture

26.20. algebraic

By default the function in \psplot has to be described in Reversed Polish Notation. The option algebraic allows you to do this in the common algebraic notation. E.g.:

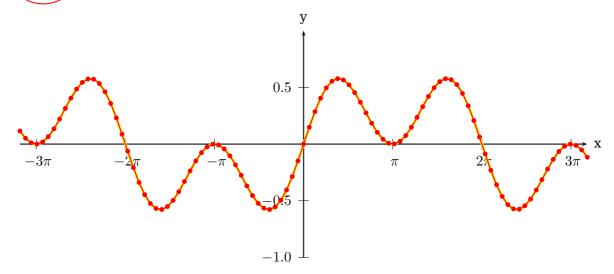

algebraic
ln(x)
cos(x)*2.71^(-x/10)
4*cos(1/x)
4*cos(1/x) cos(t) sin(t)

Setting the option algebraic to true, allow the user to describe all expression to be written in the classical algebraic notation (infix notation). The four arithmetic operations are obviously defined +-*/, and also the exponential operator ^. The natural priorities are used : $3+4\times 5^5=3+(4\times (5^5))$, and by default the computation is done from left to right. The following functions are defined :

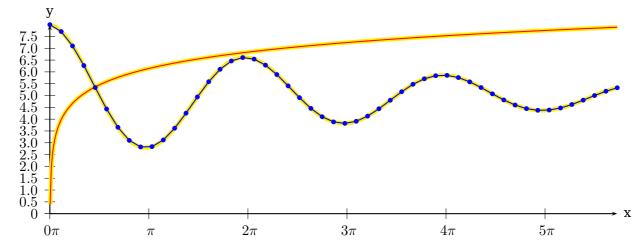

sin, cos, tan, acos, asin	in radians
log, ln	
ceiling, floor, truncate, round	
sqrt	square root
abs	absolute value
fact	for the factorial
Sum	for building sums
IfTE	for an easy case structure

These options can be used with all plot macros.

Using the option algebraic implies that all angles have to be in radians! For the \parametricplot the two parts must be divided by the | character:

```
psset{lly=-0.5cm}
psgraph[trigLabels,dx=\psPi,dy=0.5,Dy=0.5]{->}(0,0)(-10,-1)(10,1){\
    linewidth}{6cm}
psset{algebraic,plotpoints=1000}
psplot[linecolor=yellow,linewidth=2pt]{-10}{10}{0.75*sin(x)*cos(x/2)}
psplot[linecolor=red,showpoints=true,plotpoints=101]{-10}{10}{0.75*sin(x)}
*cos(x/2)}
endpsgraph
```

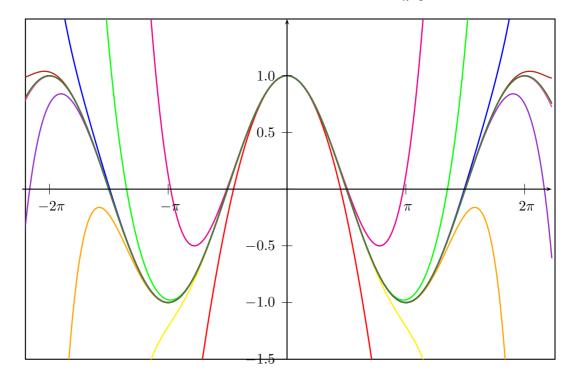

```
1 \psset{lly=-0.5cm}
2 \psgraph(0,-5)(18,3){15cm}{5cm}
3 \psset{algebraic,plotpoints=501}
4 \psplot[linecolor=yellow, linewidth=4\pslinewidth]{0.01}{18}{ln(x)}
5 \psplot[linecolor=red]{0.01}{18}{ln(x)}
6 \psplot[linecolor=yellow,linewidth=4\pslinewidth]{0}{18}{3*cos(x)*2.71^(-x /10)}
7 \psplot[linecolor=blue,showpoints=true,plotpoints=51]{0}{18}{3*cos(x)*2.71^(-x /10)}
8 \endpsgraph
```

Using the Sum function

\Sum(<index name>,<start>,<step>,<end>,<function>)

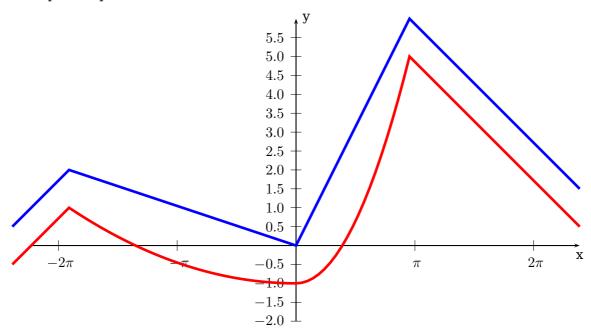

Let's plot the first development of cosine with polynomials: $\sum_{n=0}^{+\infty} \frac{(-1)^n x^{2n}}{n!}.$

Using the IfTE function

```
IfTE(<condition>,<true part>,<false part>)
```

Nesting of several IfTE is possible and seen in the following examples. A classic example is a piece-wise linear function.

```
begin{pspicture}(-7.5,-2.5)(7.5,6)

psaxes{->}(0,0)(-7,-2)(7.5,6)[x,-90][y,0]

psset{algebraic=true, plotpoints=21,linewidth=2pt}

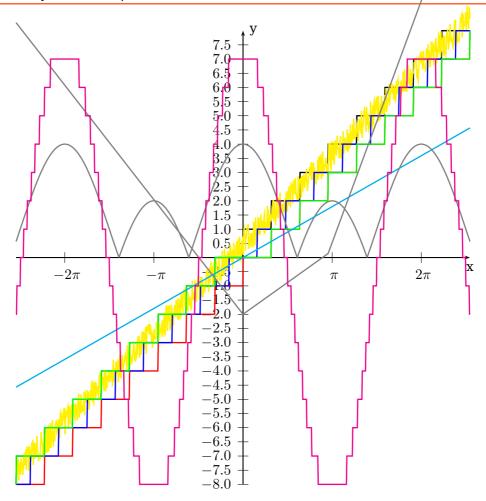

psplot[linecolor=blue]{-7.5}{7.5}{IfTE(x<-6,8+x,IfTE(x<0,-x/3,IfTE(x<3,2*x,9-x)))}

psplot[linecolor=red, plotpoints=101]{-7.5}{7.5}{%

    IfTE(2*x<-2^2*sqrt(9),7+x,IfTE(x<0,x^2/18-1,IfTE(x<3,2*x^2/3-1,8-x)))}%

end{pspicture}</pre>
```

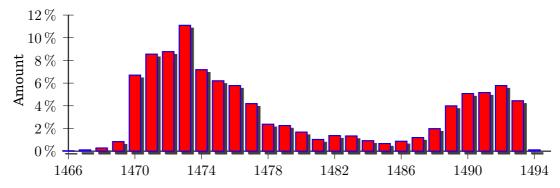

When you program a piece-wise defined function you must take care that a plotting point must be put at each point where the description changes. Use showpoints=true to see what's going on when there is a problem. You are on the safe side when you choose a big number for plotpoints.

```
\psset{unit=0.75}
         \begin{pspicture}(-8,-8)(8,8)
              psaxes{->}(0,0)(-8,-8)(8,8)[x,-90][y,0]
              \psset{plotpoints=1000,linewidth=1pt}
              \psplot[algebraic, linecolor=yellow]{-8}{8}{rand/(2^31-1)+x}
              \psplot[algebraic]{-8}{8}{ceiling(x)}
              \psplot[algebraic, linecolor=red]{-8}{8}{floor(x)}
             \psplot[algebraic, linecolor=blue]{-8}{8}{round(x)}
             \psplot[algebraic, linecolor=green]{-8}{8}{truncate(x)}
             \protect{psplot[algebraic, linecolor=cyan]{-8}{8}{div(mul(4,x),7)}}
             \protect{\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\pr
             \psplot[algebraic, linecolor=gray]{-8}{8}{abs(3*cos(x)+1)}
12
              \psplot[algebraic, linecolor=magenta]{-8}{8}{floor(8*cos(x))}
13
        \end{pspicture}
```

26.21. Plot style bar and option barwidth

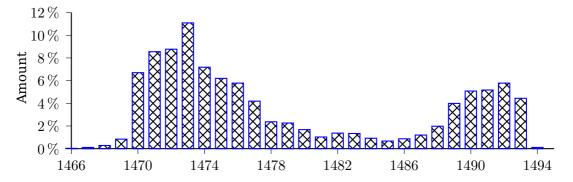

This option allows you to draw bars for the data records. The width of the bars is controlled by the option barwidth, which is set by default to value of $0.25 \, \text{cm}$, which is the total width.

```
\psset{xunit=.44cm,yunit=.3cm}
\begin{pspicture}(-2,-3)(29,13)

\psaxes[axesstyle=axes,0x=1466,0y=0,Dx=4,Dy=2,xticksize=-6pt 0,
    ylabelFactor={\,\%}]{-}(29,12)

\listplot[shadow=true,linecolor=blue,plotstyle=bar,barwidth=0.3cm,
    fillcolor=red,fillstyle=solid]{\barData}
    \rput{90}(-3,6.25){Amount}
\end{pspicture}
```

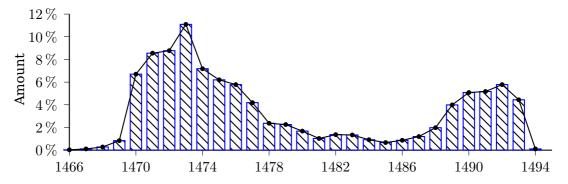

```
\psset{xunit=.44cm,yunit=.3cm}
\begin{pspicture}(-2,-3)(29,13)

\psaxes[axesstyle=axes,0x=1466,0y=0,Dx=4,Dy=2,ticksize=-4pt 0,
    ylabelFactor={\,\%}]{-}(29,12)

\listplot[linecolor=blue,plotstyle=bar,barwidth=0.3cm,
    fillcolor=red,fillstyle=crosshatch]{\barData}
\rput{90}(-3,6.25){Amount}

\end{pspicture}
```

```
\psset{xunit=.44cm,yunit=.3cm}
\begin{pspicture}(-2,-3)(29,13)

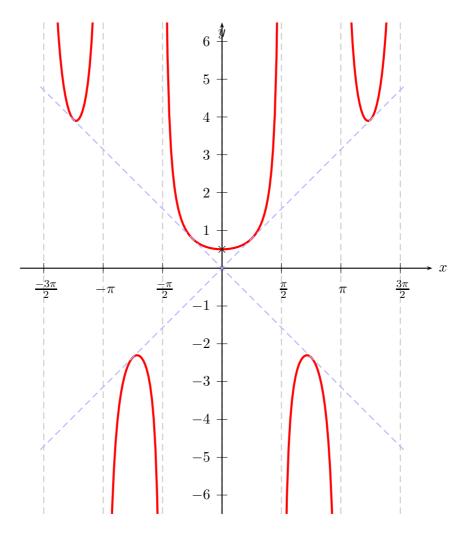

\psaxes[axesstyle=axes,0x=1466,0y=0,Dx=4,Dy=2,ticksize=-4pt 0,
    ylabelFactor={\,\%}]{-}(29,12)

\listplot[linecolor=blue,plotstyle=bar,barwidth=0.3cm,
    fillcolor=red,fillstyle=vlines]{\barData}

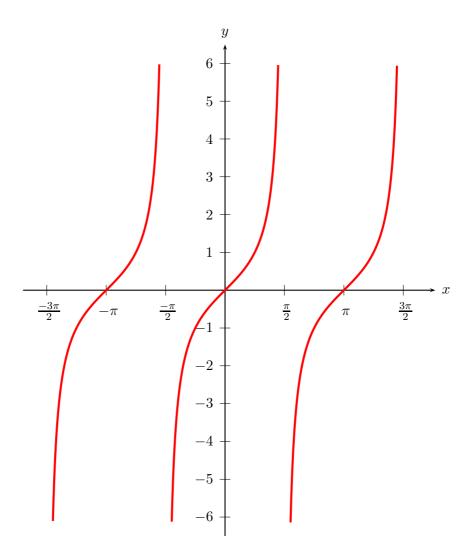

\listplot[showpoints=true]{\barData}
\rput{90}(-3,6.25){Amount}
\end{pspicture}
```

26.22. New options yMaxValue

With the new optional argument yMaxValue one can control the behaviour of discontinued functions, like the tangent function. If yMaxValue is set to a negative value, then the internal if clause is disabled, the function is plotted in the usual way as known from pst-plot.

```
begin{pspicture}(-6.5,-7)(6.5,7.5)
wultido{\rA=-4.71239+\psPiH}{7}{%
   \psline[linecolor=black!20,linestyle=dashed](\rA,-6.5)(\rA,6.5)}
   \psaxes[trigLabelBase=2,dx=\psPiH,
        xunit=\psPi,trigLabels]{->}(0,0)(-1.7,-6.5)(1.77,6.5)[$x$,0][$y$,-90]
   \psset{algebraic,plotpoints=200,plotstyle=line}
   \psclip{\psframe[linestyle=none](-4.55,-6.5)(5.55,6.5)}
   \psplot[yMaxValue=10,linewidth=1.6pt,linecolor=red]{-4.55}{4.55}{(x)/(sin (2*x))}
   \endpsclip
   \psplot[linestyle=dashed,linecolor=blue!30]{-4.8}{4.8}{x}
   \psplot[linestyle=dashed,linecolor=blue!30]{-4.8}{4.8}{-x}
   \rput(0,0.5){$\times$}
   \end{pspicture}
```

```
\begin{pspicture}(-6.5,-7)(6.5,7.5)

\psaxes[trigLabelBase=2,dx=\psPiH,

xunit=\psPi,trigLabels]{->}(0,0)(-1.7,-6.5)(1.77,6.5)[$x$,0][$y$,90]

\psset{algebraic}

\psplot[yMaxValue=6,linewidth=1.6pt,plotpoints=2000,

linecolor=red]{-4.55}{4.55}{tan(x)}

\end{pspicture}
```

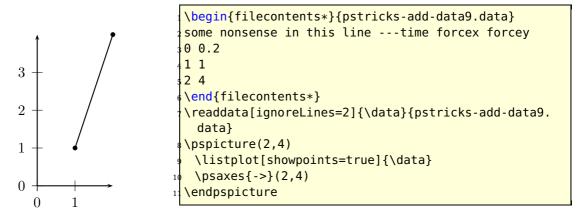

26.23. New options for \readdata

By default the macro \readdata reads every data record, which could be annoying when you have some text lines at top of your data files or when there are more than 10000 records to read.

pstricks-add defines two additional keys ignoreLines and nStep, which allows you to ignore preceding lines, e.g. ignoreLines=2, or to read only a selected part of the data records, e.g. nStep=10, only every 10th record is saved.

```
1 \readdata[ignoreLines=2]{\dataA}{stressrawdata.data}
2 \readdata[nStep=10]{\dataA}{stressrawdata.data}
```

The default value for ignoreLines is 0 and for nStep is 1. the following data file has two text lines which shall be ignored by the \readdata macro:

26.24. New options for \listplot

By default the plot macros \dataplot, \fileplot and \listplot plot every data record. The package pst-plot-add defines additional keys nStep, nStart, nEnd, and xStep, xStart, xEnd, which allows to plot only a selected part of the data records, e.g. nStep=10. These "'n"' options mark the number of the record to be plot (0,1,2,...) and the "'x"' ones the x-values of the data records.

Name	Default setting
nStart	1
nEnd	{}
nStep	1
xStart	{}
xEnd	{}
yStart	{}
yEnd	{}
xStep	0
plotNo	1
plotNoMax	1
ChangeOrder	false
(plotstyle)	line

These new options are only available for the \listplot macro, which is not a real limitation, because all data records can be read from a file with the \readdata macro (see example files or [5]):

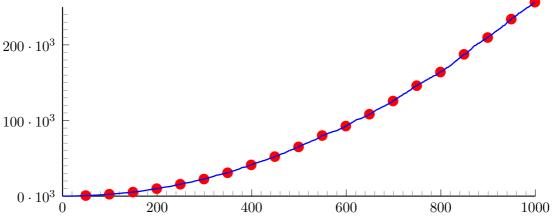

\readdata[nStep=10]{\data}{/home/voss/data/data1.data}

The use nStep and xStep options only make real sense when also using the option plotstyle=dots . Otherwise the coordinates are connected by a line as usual. Also the xStep option needs increasing x values. Note that nStep can be used for \readdata and for \listplot. If used in both macros then the effect is multiplied, e.g. \readdata with nStep=5 and \listplot with nStep=10 means, that only every 50^{th} data record is read and plotted.

When both, x/yStart/End are defined then the values are also compared with both values.

Example for nStep/xStep

The datafile data.data contains 1000 data records. The thin blue line is the plot of all records with the plotstyle option curve.

```
\readdata{\data}{data.data}

\psset{xunit=12.5cm,yunit=0.2mm}

\begin{pspicture}(-0.080,-30)(1,270)

\pstScalePoints(1,1){1000 div}{1000 div}

    \prootember{psline}[linewidth=.01]{->}(0.78,200)(1,100)
20
    \rput[l](1.02,100){\footnotesize closing volume}
  \end{pspicture}
```

Example for yStart/yEnd

```
\readdata{\data}{data.data}

\psset{xunit=12.5cm,yunit=0.2mm}

\begin{pspicture}(-0.080,-30)(1,270)

\pstScalePoints(1,1){1000 div}{1000 div}

\spsaxes[axesstyle=frame,Dx=200,dx=2.5cm,Dy=100,ticksize=0 5pt,tickstyle=inner,

ylabelFactor=\cdot10^3,dy=2cm](0,0)(1,250)

\psset{linewidth=0.1pt, linestyle=dashed,linecolor=red}

\psline(0,40)(1,40)

\psline(0,40)(1,175)

\listplot[yStart=40000, yEnd=175000,linewidth=3pt,linecolor=blue,plotstyle=dots]{\data}

\end{pspicture}
```

Example for plotNo/plotNoMax

By default the plot macros expect x|y data records, but when having data files with multiple values for y, like:

```
x y1 y2 y3 y4 ... yMax
x y1 y2 y3 y4 ... yMax
...
```

you can select the y value which should be plotted. The option plotNo marks the plotted value (default 1) and the option plotNoMax tells pst-plot how many y values are present. There are no real restrictions in the maximum number for plotNoMax.

We have the following data file:

```
[% file data.data

0  0  3.375  0.0625

10  5.375  7.1875  4.5

20  7.1875  8.375  6.25

30  5.75  7.75  6.6875

40  2.1875  5.75  5.9375

50  -1.9375  2.1875  4.3125

60  -5.125  -1.8125  0.875
```

```
70 -6.4375 -5.3125 -2.6875

80 -4.875 -7.1875 -4.875

90 0 -7.625 -5.625

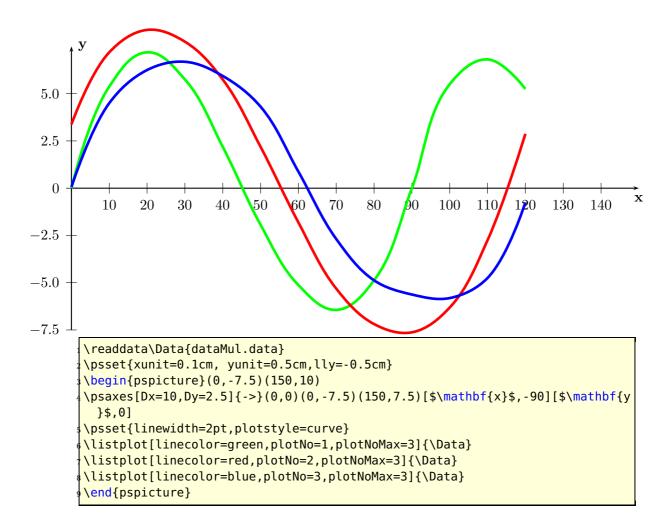

100 5.5 -6.3125 -5.8125

110 6.8125 -2.75 -4.75

120 5.25 2.875 -0.75

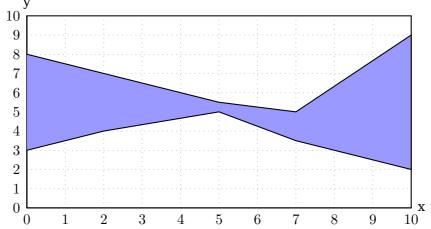

]%
```

which holds data records for multiple plots (x y1 y2 y3). This can be plotted without any modification to the data file:

Example for changeOrder

It is only possible to fill the region between two listplots with \pscustom if one of them has the values in reverse order. Otherwise we do not get a closed path. With the option ChangeOrder the values are used in reverse order:

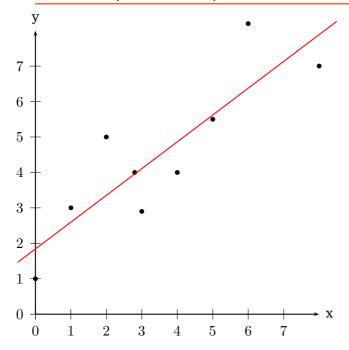

```
begin{filecontents*}{test.data}
0 3 8
2 4 7
5 5 5 5.5
7 3.5 5
10 2 9
\tend{filecontents*}
\text{lly=-.5cm}
\text{begin{psgraph}[axesstyle=frame,ticklinestyle=dotted,ticksize=0 10](0,0)
(10,10){4in}{2in}%
\text{readdata{\data}{test.data}%
\text{pscustom[fillstyle=solid,fillcolor=blue!40]{%
\text{listplot[plotNo=2,plotNoMax=2]{\data}%}
\text{listplot[plotNo=1,plotNoMax=2,ChangeOrder]{\data}}
\tend{psgraph}
```

Example for plotstyle

The plotstyle option is defined in the package pst-plot, but its value LSM (Least Square **Method**) is only valid for the pstricks-add package. Instead of plotting the data records as dots or a line, the \listplot macro calculates the values for a line $Y_y = v \cdot x + u$ which fits best all data records.

```
7
6
5
4
3
2
1
0
            2
                 3
                           5
                                 6
                                      7
    \begin{filecontents*}{LSM.data}
    0 1 1 3 2.8 4 3 2.9 2 5 4 4 5 5.5 6 8.2 8 7
    \end{filecontents*}
    \psset{lly=-.5cm}
    \readdata{\data}{LSM.data}
    \begin{psgraph}[arrows=->](0,0)(0,0)(8,8){.5\textwidth}{!}
      \listplot[plotstyle=dots]{\data}
      \listplot[plotstyle=LSM, linecolor=red] {\data}
    \end{psgraph}
```

The macro looks for the lowest and biggest x-value and draws the line for this interval. It is possible to pass other values to the macro by setting the xStart and/or xEnd options. They are preset with an empty value {}.

y=0.755679 x+1.84105

```
begin{filecontents*}{LSM.data}
0 1 1 3 2.8 4 3 2.9 2 5 4 4 5 5.5 6 8.2 8 7

end{filecontents*}

readdata{\data}{LSM.data}

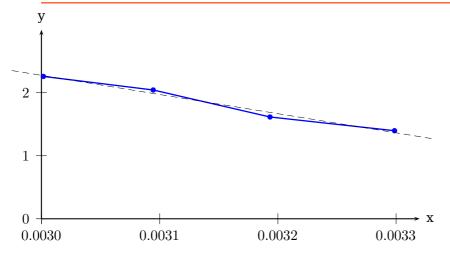

psset{lly=-1.75cm}
begin{psgraph}[arrows=->](0,0)(0,0)(8,8){.5\textwidth}{!}

listplot[plotstyle=dots]{\data}

listplot[PstDebug=1,plotstyle=LSM,xStart=-0.5,xEnd=8.5,linecolor=red]{\data}

end{psgraph}
```

With PstDebug=1 one gets the equation $y=v\cdot x+u$ printed, beginning at the position (0|-50pt). This cannot be changed, because it is only for some kind of debugging. Pay attention for the correct xStart and xEnd values, when you use the \pstScalePoints Macro. In the following example we use an x-interval from 0 to 3 to plot the values; first we subtract 0.003 from all x-values and then scale them with 10000. This is not taken into account for the xStart and xEnd values.

y=-0.162184 x+2.27634

```
\begin{filecontents*}{LSM.data}
 0.003298697 1.397785583
<sup>3</sup> 0.003193358 1.615489564
 0.003094538 2.044019006
 0.003001651 2.259240127
 \end{filecontents*}
  \readdata{\data}{LSM.data}
 \pstScalePoints(10000,1){ 0.003 sub }{}
  \psset{lly=-1.75cm}
 \proopsymbol{psgraph[arrows=->,0x=0.0030,Dx=0.0001,dx=\proopsymbol{o},0)(3.2,3){10cm}{5cm}}
   \listplot[showpoints=true,linewidth=1pt,linecolor=blue]{\data}
   \listplot[PstDebug=1,plotstyle=LSM,linewidth=0.1pt,linestyle=dashed,%
12
     xStart=-0.25,xEnd=3.3]{\data}
13
  \endpsgraph
```

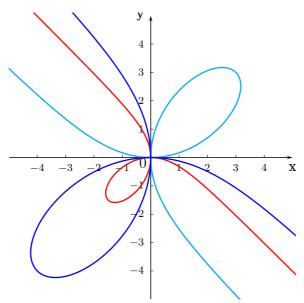

27. Polar plots

27. Polar plots

With the option polarplot=false|true it is possible to use \psplot in polar mode:

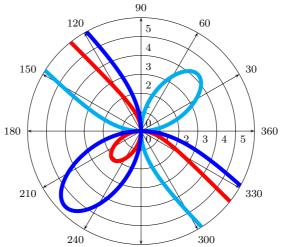

The equation in PostScript code is interpreted as a function $r=f(\alpha)$, e.g. for the circle with radius 1 as $r=\sqrt{\sin^2 x + \cos^2 x}$, or $r=a*\frac{\sin(x)*\cos(x)}{(\sin(x)^3 + \cos(x)^3)}$ for the following examples:

```
x sin dup mul x cos dup mul add sqrt
```

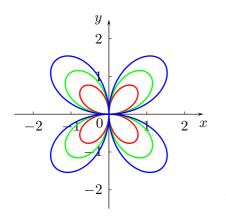

```
| \psset{plotpoints=200,unit=0.75} |
| \pspicture*\{(-5,-5)(5.1,5.1) |
| \psaxes[arrowlength=1.75,ticksize=2pt,labelFontSize=\scriptstyle, |
| \linewidth=0.2mm]\{->\}(0,0)(-4.99,-4.99)(5,5)[x,-90][y,180] |
| \rput[Br](-.15,-.35)\{\$0\$\} \psset\{\linewidth=.35mm,polarplot\} |
| \psplot[\linecolor=red]\{140\}\{310\}\{3 \text{ neg x sin mul x cos mul x sin 3 exp x cos 3 exp add div\} |
| \psplot[\linecolor=cyan]\{140\}\{310\}\{6 \text{ x sin mul x cos mul x sin 3 exp x cos 3 exp add div\} |
| \psplot[\linecolor=blue,algebraic]\{2.44\}\{5.41\}\{-8*\sin(x)*\cos(x)/(\sin(x)^3+\cos(x)^3)\} |
| \end{\pspicture*}
```

27. Polar plots

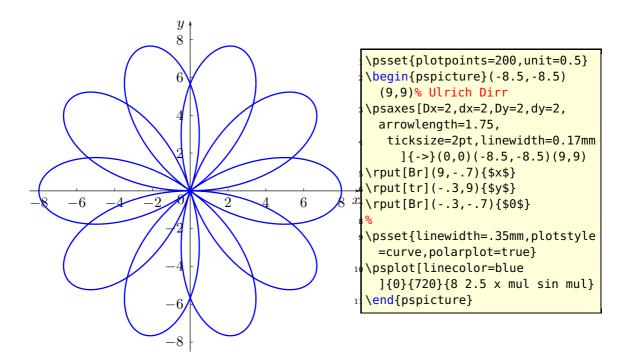

```
\psset{unit=0.5cm}
\begin{pspicture}(-6,-6)(6,6)
\psaxes[axesstyle=polar,labelFontSize=\scriptstyle,linewidth=0.2mm]{->}(6,6)
\psset{linewidth=3pt,polarplot,plotpoints=500,plotstyle=curve}
\psclip{\pscircle[linestyle=none]{6}}
\psplot[linecolor=red]{140}{310}{3 neg x sin mul x cos mul x sin 3 exp x cos 3 exp add div}
\psplot[linecolor=cyan]{140}{310}{6 x sin mul x cos mul x sin 3 exp x cos 3 exp add div}
\psplot[linecolor=blue,algebraic]{2.44}{5.41}{-8*sin(x)*cos(x)/(sin(x)^3+cos(x)^3)}
\end{psplotcure}
```

```
\psset{plotpoints=200,unit=1}
\begin{pspicture}(-2.5,-2.5)(2.5,2.5)% Ulrich

\rput[Br](-.15,-.35){$0$}
\psset{linewidth=.35mm,plotstyle=curve,
    polarplot=true}
\psplot[linecolor=red]{0}{360}{x cos 2 mul x
    sin mul}
\psplot[linecolor=green]{0}{360}{x cos 3 mul x
    sin mul}
\psplot[linecolor=blue]{0}{360}{x cos 4 mul x
    sin mul}
\end{pspicture}
```

27. Polar plots

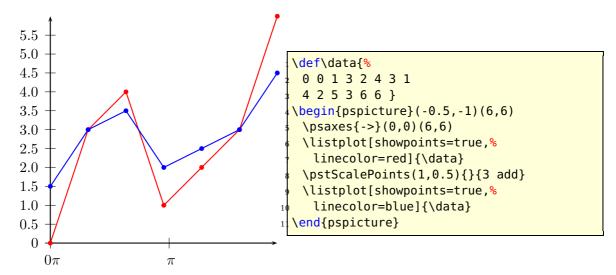

28. \pstScalePoints

The syntax is

```
\verb|\pstScalePoints(xScale,xScale){xPS}{yPS}|
```

xScale,yScale are decimal values used as scaling factors, the xPs and yPS are additional PostScript code applied to the x- and y-values of the data records. This macro is only valid for the \listplot macro!

\pstScalePoints(1,0.5){}{3 add} means that **first** the value 3 is added to the y values and **second** this value is scaled with the factor 0.5. As seen for the blue line for x = 0 we get $y(0) = (0+3) \cdot 0.5 = 1.5$.

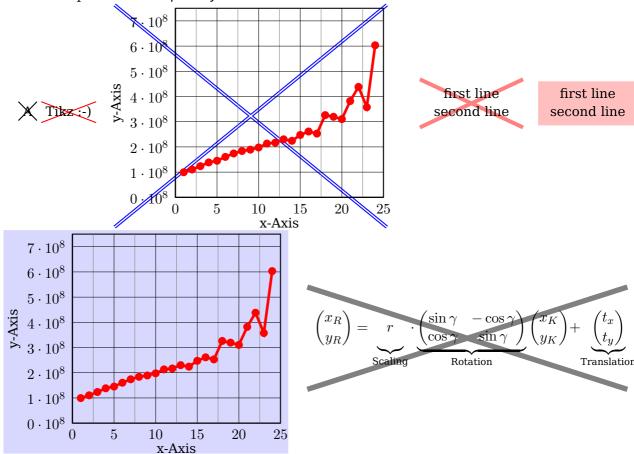

Changes with \pstScalePoints are always global to all following \listplot macros. This is the reason why it is a good idea to reset the values at the end of the pspicture environment.

Part IV. New commands and environments

29. psCancel environment¹

This macro works like the \cancel macro from the package of the same name but it allows as argument any contents, not only letters but also a complex graphic.

All optional arguments for lines and boxes are valid and can be used in the usual way. The star option fills the underlying box rectangle with the linecolor. This can be transparent if opacity is set to a value less than 1. This can be used in presentation to strike out words, equations, and graphic objects. Lines can also be transparent when the option strokeopacity is used.

¹ Thanks to by Stefano Baroni

```

30. psgraph environment

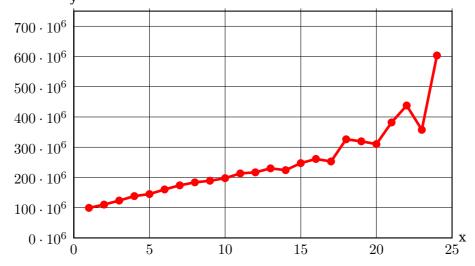

This new environment psgraph does the scaling, it expects as parameter the values (without units!) for the coordinate system and the values of the physical width and height (with units!). The syntax is:

```
\psgraph [Options] {<arrows>}%
     (xOrig,yOrig)(xMin,yMin)(xMax,yMax){xLength}{yLength}
...
\endpsgraph
\begin{psgraph} [Options] {<arrows>}%
     (xOrig,yOrig)(xMin,yMin)(xMax,yMax){xLength}{yLength}
...
\end{psgraph}
```

where the options are valid **only** for the the \psaxes macro. The first two arguments have the usual PSTricks behaviour.

- if (xOrig, yOrig) is missing, it is substituted to (xMin, xMax);
- if (x0rig,y0rig) and (xMin,yMin) are missing, they are both substituted to (0,0).

The y-length maybe given as !, when the macro uses the same unit as for the x-axis.

```
\readdata{\data}{demo1.data}

\pstScalePoints(1,0.000001){}{}% (x,y){additional x operator}{y op}

\psset{llx=-1cm,lly=-1cm}

\begin{psgraph} [axesstyle=frame,xticksize=0 759,yticksize=0 25,%

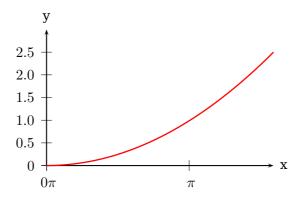

subticks=0,ylabelFactor=\cdot 10^6,

| \listplot[linewidth=2pt]{\data}
| \psaxes[axesstyle=frame, ticksize=0 5pt, xsubticks=20, ysubticks=4, tickstyle=inner, dy=2, Dy=2, tickwidth=1.5pt, subtickcolor=black](0,0)(3,9)
| \rput*(2.5,3){level 1}\rput*(1,7){level 2}
| \end{psgraph}
```

30.1. The new options

name	default	meaning
xAxisLabel	Х	label for the x-axis
yAxisLabel	у	label for the y-axis
xAxisLabelPos	{}	where to put the x-label
yAxisLabelPos	{}	where to put the y-label
llx	0pt	trim for the lower left x
lly	0pt	trim for the lower left y
urx	0pt	trim for the upper right x
ury	0pt	trim for the upper right y

30.2. Problems **129**

There is one restriction in using the trim parameters, they must been set **before** \psgraph is called. They are redundant when used as parameters of \psgraph itself. The ?AxisLabelPos options can use the letter c for centering an x-axis or y-axis label. The c is a replacement for the x or y value. When using values with units, the position is always measured from the origin of the coordinate system, which can be outside the visible pspicture environment

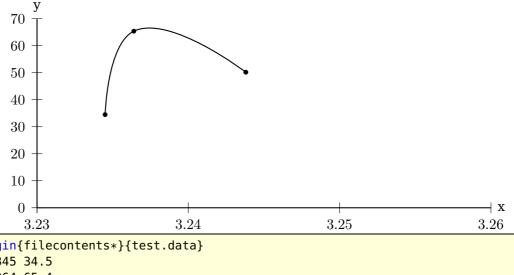

```
| \readdata{\data}{\data}{\data}\
| \readdata{\dataII}{\demo3.data}\*
| \psset{\lx--1cm,\ly--1.25cm,\urx=0.5cm,\ury=0.1in,\xAxisLabel=Year,\*
| \quad \quad
```

30.2. Problems

Floating point operations in TEX are a real mess, which causes a lot of problems when there are very small or very big units. With the options of pst-plot it is possible to choose normal units (whatever this may be ...), and plot the data as usual.

30.2. Problems 130

This example shows some important facts:

- 3.23 sub 100 mul: the x values are now 0.45; 0.64; 1.38
- 0x=3.23: the origin of the x axis is set to 3.23
- Dx=0.01: the increment of the labels
- dx=\psxunit: uses the calculated unit value to get every unit a label
- Dy=10: increase the y labels by 10

Using the internal $\protect\operatorname{psxunit}$ one can have dynamical x-units, depending on the linewidth of the document.

31. \psStep

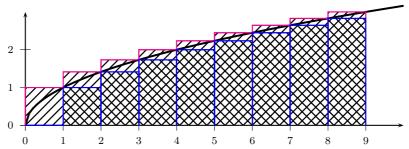

31. \psStep

\psStep calculates a step function for the upper or lower sum or the max/min of the Riemann integral definition of a given function. The available option is

StepType=lower |upper|Riemann|infimum|supremum or alternative StepType=l |u|R|i|s with lower as the default setting. The syntax of the function is

```
\psStep [Options] (()x1,x2){n}{function}
```

(x1,x2) is the given interval for the step wise calculated function, n is the number of the rectangles and *function* is the mathematical function in postfix or algebraic notation (with algebraic=true).

```
\begin{pspicture}(-0.5,-0.5)(10,3)

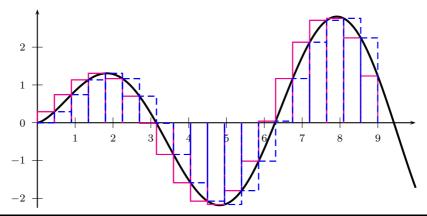

\psaxes[labelFontSize=\scriptstyle]{->}(10,3)

\psplot[plotpoints=100,linewidth=1.5pt,algebraic]{0}{10}{sqrt(x)}

\psStep[linecolor=magenta,StepType=upper,fillstyle=hlines](0,9){9}{x sqrt}

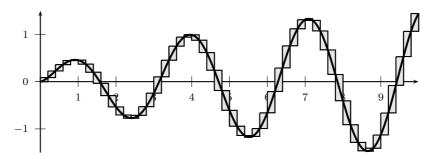

\psStep[linecolor=blue,fillstyle=vlines](0,9){9}{x sqrt}

\end{pspicture}
```

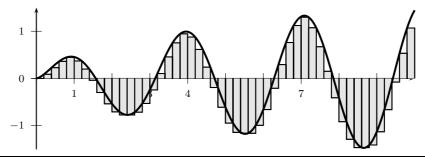

```
| \psset{plotpoints=200}
| \pspicture \{(-0.5, -2.25)(10,3) \psaxes[labelFontSize=\scriptstyle] \{->\}(0,0)(0,-2.25)(10,3) \psplot[linewidth=1.5pt,algebraic] \{0\} \{10\} \{sqrt(x)*sin(x)\} \psStep[algebraic,linecolor=magenta,StepType=upper](0,9) \{20\} \{sqrt(x)*sin(x) \} \psStep[linecolor=blue,linestyle=dashed](0,9) \{20\} \{x sqrt x RadtoDeg sin mul \} \\ \end{pspicture}
```

31. \psStep **132**

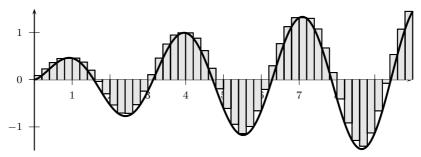

```
\psset{yunit=1.25cm,plotpoints=200}
\begin{pspicture}(-0.5,-1.5)(10,1.5)
\psaxes[labelFontSize=\scriptstyle]{->}(0,0)(0,-1.5)(10,1.5)
\psStep[algebraic,StepType=Riemann,fillstyle=solid,fillcolor=black

32. Plotting tangent lines

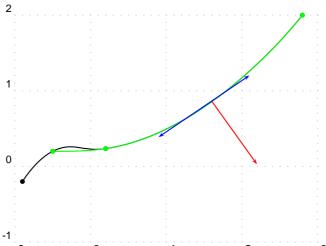

There are two macros for plotting a tangent line or the tangent normal line. The first one is $\protect\prote$

32.1. \psTangentLine and option Tnormal

```
\verb|\psTangentLine| [Options]| ((x_1,y_1))((x_2,y_2))((x_3,y_3))\{x\}\{dx\}
```

```
| \text{vnit=2} \|
| \text{begin}{pspicture}[showgrid=true](1,-1)(4,1) \|
| \text{pscurve}[showpoints=true] \|
| (2.1,-0.2)(2.5,0.2)(3.2,0.235)(3.8,-0.2) \|
| \text{psTangentLine}[Tnormal,arrows=->, \|
| \text{linecolor=red}[(2.5,0.2)(3.2,0.235)% \|
| (3.8,-0.2){3}{0.1} \|
| \text{psTangentLine}[arrows=<->, \|
| \text{linecolor=blue}[(2.5,0.2)(3.2,0.235)% \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-0.2){3}{0.5} \|
| (3.8,-
```

In special cases one has to use curvature=1 1 1 for the macro \pscurve to get the same equation for the curve as \psplotTangentLine does.

```
\psset{unit=2}
\begin{pspicture}[showgrid=true](2,-1)(6,2)
\pscurve[showpoints=true,
    curvature=1 1 1](2.1,-0.2)(2.5,0.2)(3.2,0.235)(5.8,2)
\pscurve[showpoints=true,linecolor=green,
    curvature=1 1 1](2.5,0.2)(3.2,0.235)(5.8,2)
\psTangentLine[Tnormal,arrows=->,linecolor=red](2.5,0.2)(3.2,0.235)(5.8,2){4.6}{0.6}
\psTangentLine[arrows=<->,linecolor=blue](2.5,0.2)(3.2,0.235)(5.8,2){4.5}{0.6}
\end{pspicture}
```

32.2. \psplotTangent and option Tnormal

There is an additional option, named Derive for an alternative function (see following example) to calculate the slope of the tangent. This will be in general the first derivative, but can also be any other function. If this option is different to to the default value Derive=default , then this function is taken to calculate the slope. For the other cases, pstricks-add builds a secant with -0.00005<x<0.00005, calculates the slope and takes this for the tangent. This may be problematic in some cases of special functions or x values, then it may be appropriate to use the Derive option.

```
\verb|\psplotTangent*| [Options] {$x$} {$dx$} {$function$}
```

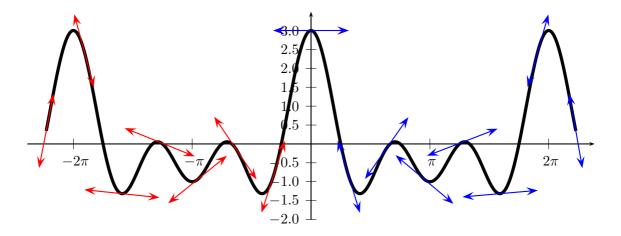

The macro expects three parameters:

x: the x value of the function for which the tangent should be calculated

dx: the dx to both sides of the x value

f(x): the function in infix (with option algebraic) or the default postfix (PostScript) notation

The following examples show the use of the algebraic option together with the Derive option. Remember that using the algebraic option implies that the angles have to be in the radian unit!

```
\def\F{x RadtoDeg dup dup cos exch 2 mul cos add exch 3 mul cos add}
\def\Fp{x RadtoDeg dup dup sin exch 2 mul sin 2 mul add exch 3 mul sin 3 mul
    add neg}

\psset{plotpoints=1001}
\begin{pspicture}(-7.5,-2.5)(7.5,4)%X\psgrid

\psaxes{->}(0,0)(-7.5,-2)(7.5,3.5)

\psplot[linewidth=3\pslinewidth]{-7}{7}{\F}

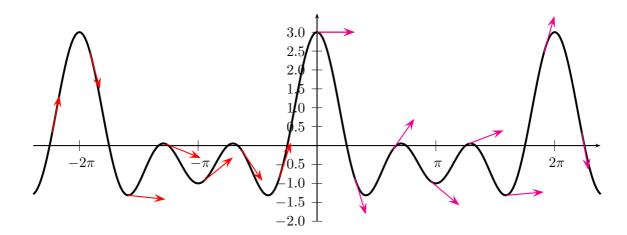

\psset{linecolor=red, arrows=<->, arrowscale=2}

\multido{\n=-7+1}{8}{\psplotTangent{\n}{1}{\F}}

\psset{linecolor=magenta, arrows=<->, arrowscale=2}%
```

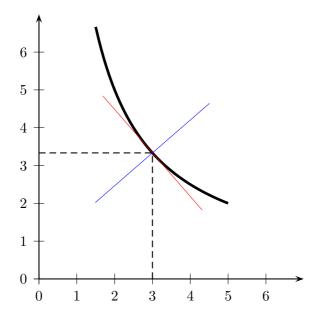

```
\label{linecolor} $$ \mathbf{0}_{n=0+1}_{8}^{\infty} \left[ \operatorname{linecolor=blue}, \operatorname{Derive=\Fp}_{n}_{1}^{1}_{n}_{1}^{1} \right] $$
```

The star version plots only the tangent line in the positive *x*-direction:

```
\def\Falg{cos(x)+cos(2*x)+cos(3*x)} \def\Fpalg{-sin(x)-2*sin(2*x)-3*sin(3*x)}
\begin{pspicture}(-7.5,-2.5)(7.5,4)%\psgrid
\psaxes{->}(0,0)(-7.5,-2)(7.5,3.5)
\psplot[linewidth=1.5pt,algebraic,plotpoints=500]{-7.5}{7.5}{\Falg}
\multido{\n=-7+1}{8}{\psplotTangent*[linecolor=red,arrows=->,arrowscale=2,algebraic]{\n}{1}{\Falg}}
\multido{\n=0+1}{8}{\psplotTangent*[linecolor=magenta,%arrows=->,arrowscale=2,algebraic,Derive={\Fpalg}]{\n}{1}{\Falg}}
\end{pspicture}
```

The next example shows the use of the \mbox{Derive} option to draw the perpendicular line to the tangent.

```
begin{pspicture}(-0.5,-0.5)(7.25,7.25)

def\Func{10 x div}

psaxes[arrowscale=1.5]{->}(7,7)

psplot[linewidth=2pt,algebraic
   ]{1.5}{5}{10/x}

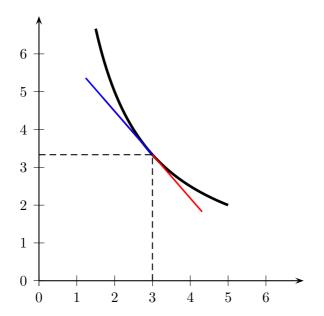

psplotTangent[linewidth=.5\pslinewidth,
   linecolor=red,algebraic]{3}{2}{10/x}

psplotTangent[linewidth=.5\pslinewidth,
   linecolor=blue,algebraic,Derive=(x*x)
   /10]{3}{2}{10/x}

psline[linestyle=dashed](!0 /x 3 def \
   Func)(!3 /x 3 def \Func)(3,0)

end{pspicture}
```

By setting the optional argument Tnormal one can plot the normal of the tangent line. It always starts at the given point.

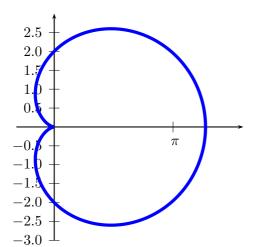

```
\begin{pspicture}(-0.5,-0.5)(7.25,7.25)
  \def\Func{10 x div}
  \psaxes[arrowscale=1.5]{->}(7,7)
  \psplot[linewidth=2pt]{1.5}{5}{\Func}
  \psplotTangent[linewidth=1.5\pslinewidth,
     linecolor=red]{3}{2}{\Func}
  \psplotTangent[linewidth=1.5\pslinewidth,
     linecolor=blue,Tnormal]{3}{2}{\Func}
  \psline[linestyle=dashed](!0 /x 3 def \Func)(!3 /x 3 def \Func)(3,0)
  \end{pspicture}
```

32.3. A polarplot example

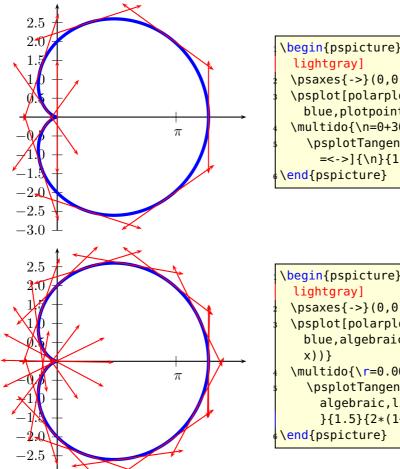

Let's work with the classical cardioid: $r=2(1+\cos(\theta))$ and $\frac{dr}{d\theta}=-2\sin(\theta)$. The Derive option always expects the $\frac{dr}{d\theta}$ value and uses internally the equation for the derivative of implicitly defined functions:

$$\frac{dy}{dx} = \frac{r' \cdot \sin \theta + x}{r' \cdot \cos \theta - y}$$

where $x = r \cdot \cos \theta$ and $y = r \cdot \sin \theta$

```
\begin{pspicture}(-1,-3)(5,3)%\psgrid[subgridcolor=
    lightgray]
  \psaxes{->}(0,0)(-1,-3)(5,3)
  \psplot[polarplot,linewidth=3\pslinewidth,linecolor=
    blue,%
    plotpoints=500]{0}{360}{1 x cos add 2 mul}
  \end{pspicture}
```

```
\begin{pspicture}(-1,-3)(5,3)%\psgrid[subgridcolor=
    lightgray]

psaxes{->}(0,0)(-1,-3)(5,3)

psplot[polarplot,linewidth=3\pslinewidth,linecolor=
    blue,plotpoints=500]{0}{360}{1 x cos add 2 mul}

multido{\n=0+36}{10}{%
    \psplotTangent[polarplot,linecolor=red,arrows
    =<->]{\n}{1.5}{1 x cos add 2 mul} }

end{pspicture}
```

```
begin{pspicture}(-1,-3)(5,3)%\psgrid[subgridcolor=
    lightgray]

psaxes{->}(0,0)(-1,-3)(5,3)

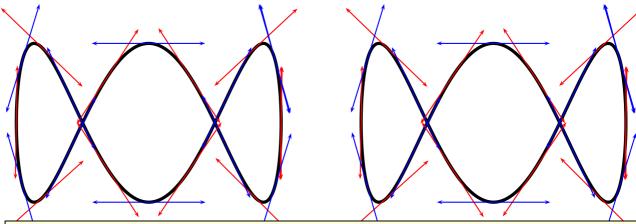

psplot[polarplot,linewidth=3\pslinewidth,linecolor=
    blue,algebraic,plotpoints=500]{0}{6.289}{2*(1+cos(x))}

multido{\r=0.000+0.314}{21}{%
    \psplotTangent[polarplot,Derive=-2*sin(x),
        algebraic,linecolor=red,arrows=<->]{\r
    }{1.5}{2*(1+cos(x))}
}
\end{pspicture}
```

32.4. A \parametricplot example

Let's work with a Lissajou curve: $\begin{cases} x = 3.5\cos(2t) \\ y = 3.5\sin(6t) \end{cases}$ whose derivative is : $\begin{cases} x = -7\sin(2t) \\ y = 21\cos(6t) \end{cases}$ The parameter must be the letter t instead of x and when using the algebraic

The parameter must be the letter t instead of x and when using the algebraic option you must separate the two equations by a \mid (see example).

```
\def\Lissa{t dup 2 RadtoDeg mul cos 3.5 mul exch 6 mul RadtoDeg sin 3.5 mul}%
       \psset{yunit=0.6}
       \begin{array}{c} \begin{array}{c} \mathbf{begin} & (-4, -4) & (4, 6) \end{array} \end{array}
            \parametricplot[plotpoints=500,linewidth=3\pslinewidth]{0}{3.141592}{\Lissa}
             \mbox{multido} {r=0.000+0.314} {11} {\%}
                   \psplotTangent[linecolor=red,arrows=<->]{\r}{1.5}{\Lissa} }
             \mbox{\mbox{multido}(\r=0.157+0.314){11}{%}}
                   \psplotTangent[linecolor=blue,arrows=<->]{\r}{1.5}{\Lissa} }
       \end{pspicture}\hfill%
10 \cdot def = 1.5 \cdot
     \begin{pspicture}(-4,-4)(4,6)
            LissaAlg}
            \mbox{multido} {r=0.000+0.314}{11}{%}
                   \psplotTangent[algebraic,linecolor=red,arrows=<->]{\r}{1.5}{\LissaAlg} }
             \mbox{multido} {r=0.157+0.314} {11} {\%}
                   \psplotTangent[algebraic,linecolor=blue,arrows=<->,%
                            Derive=\LissaAlgDer]{\r}{1.5}{\LissaAlg} }
       \end{pspicture}
```

33. Successive derivatives of a function

The new PostScript function Derive has been added for plotting successive derivatives of a function. It must be used with the algebraic option. This function has two arguments:

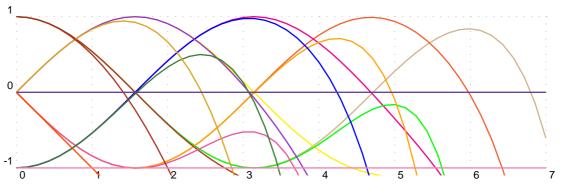

- 1. a positive integer which defines the order of the derivative; obviously 0 means the function itself!
- 2. a function of variable x which can be any function using common operators,

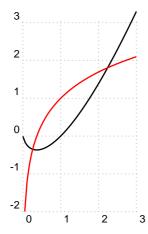

Do not think that the derivative is approximated, the internal PostScript engine will compute the real derivative using a formal derivative engine.

The following diagram contains the plot of the polynomial:

$$f(x) = \sum_{i=0}^{14} \frac{(-1)^i x^{2i}}{i!} = 1 - \frac{x^2}{2} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} - \frac{x^{10}}{10!} + \frac{x^{12}}{12!} - \frac{x^{14}}{14!}$$

and of its first 15 derivatives. It is the sequence definition of the cosine.

```
begin{pspicture}[shift=-2.5,showgrid=true,linewidth=1
  pt](0,-2)(3,3)
psplot[algebraic]{.001}{3}{x*ln(x)} % f(x)
psplot[algebraic,linecolor=red]{.05}{3}{Derive(1,x*ln(x))} % f'(x)=1+ln(x)
end{pspicture}
```

34. Variable step for plotting a curve

34.1. Theory

As you know with the \psplot macro, the curve is plotted using a piece-wise linear curve. The step is given by the parameter plotpoints. For each step between x_i and x_{i+1} , the area defined between the curve and its approximation (a segment) is majored by this formula:

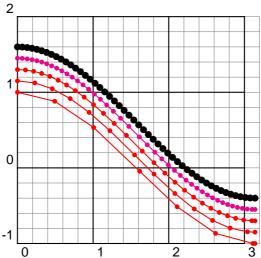

$$|\varepsilon| \leq \frac{M_2(f)(x_{i+1}-x_i)^3}{12}$$

$$M_2(f) \text{ is a majorant of the second derivative of } f \text{ in the interval } [x_i;x_{i+1}].$$

The parameter VarStep (false by default) activates the variable step algorithm. It is set to a tolerance defined by the parameter VarStepEpsilon (default by default, accept real value). If this parameter is not set by the user, then it is automatically computed using the default first step given by the parameter plotpoints. Then, for each step, $f''(x_n)$ and $f''(x_{n+1})$ are computed and the smaller is used as $M_2(f)$, and then the step is approximated. This means that the step is constant for second order polynomials.

34.2. The cosine

Different value for the tolerance from 0.01 to 0.0001, a factor 10 between each of them. In black, there is the classic \psplot behavior, and in magenta the default variable step behavior.

```
\psset{algebraic, VarStep=true, unit=2, showpoints=true, linecolor=red}

begin{pspicture}[showgrid=true](-0,-1)(3.14,2)

\psplot[VarStepEpsilon=.01]{0}{3.14}{cos(x)}

\psplot[VarStepEpsilon=.001]{0}{3.14}{cos(x)+.15}
```

34.2. The cosine **143**

```
\psplot[VarStepEpsilon=.0001]{0}{3.14}{cos(x)+.3}

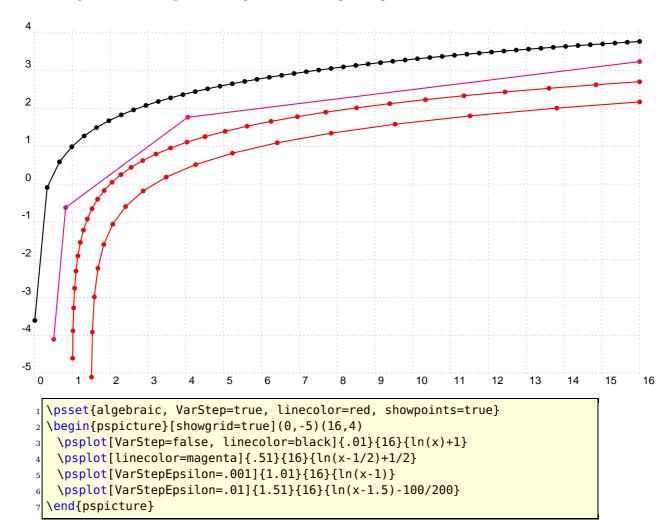

\psplot[linecolor=magenta]{0}{3.14}{cos(x)+.45}

\psplot[VarStep=false,linewidth=1pt,linecolor=black]{-0}{3.14}{cos(x)+.6}

\end{pspicture}
```

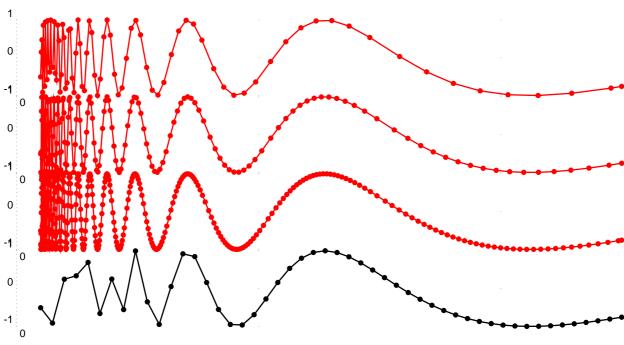

34.3. The Napierian Logarithm

A really classic example which gives a bad beginning, the tolerance is set to 0.001.

34.4. Sine of the inverse of x

Impossible to draw, but let's try!

```
psset{xunit=64,algebraic,VarStep,linecolor=red,showpoints=true,linewidth=1
pt}

begin{pspicture}[showgrid=true](0,-1)(.5,1)
    \psplot[VarStepEpsilon=.0001]{.01}{.25}{sin(1/x)}

36. \psplotDiffEqn - solving diffential equations

A differential equation of first order is like

$$y' = f(x, y, y') \tag{1}$$

where y is a function of x. We define some vectors $Y = [y, y', \dots, y^{(n-1)}]$ and $Y' = [y', y'', \dots, y^n]$, depending on the order n. The syntax of the macro is

$\label{eq:loss_problem} $$ \problem{$\problem{$

- options: the \psplotDiffEqn specific options and all other of PSTricks, which make sense;
- x_0 : the start value;
- x_1 : the end value of the definition interval;
- y_0 : the initial values for $y(x_0)$ $y'(x_0)$...;
- f(x, y, y', ...): the differential equation, depending to the number of initial values, e.g.: {0 1} for y_0 are two initial values, so that we have a differential equation of second order f(x, y, y') and the macro leaves y y' on the stack.

The new options are:

- method: integration method (euler for order 1 euler method, rk4 for 4th order Runge-Kutta method);
- whichabs: select the abscissa for plotting the graph, by default it is x, but you can specify a number which represent a position in the vector y;
- whichord: same as precedent for the ordinate, by default y(0);
- plotfuncx: describe a ps function for the abscissa, parameter whichabs becomes useless;
- plotfuncy: idem for the ordinate;
- ullet buildvector: boolean parameter for specifying the input-output of the f description:

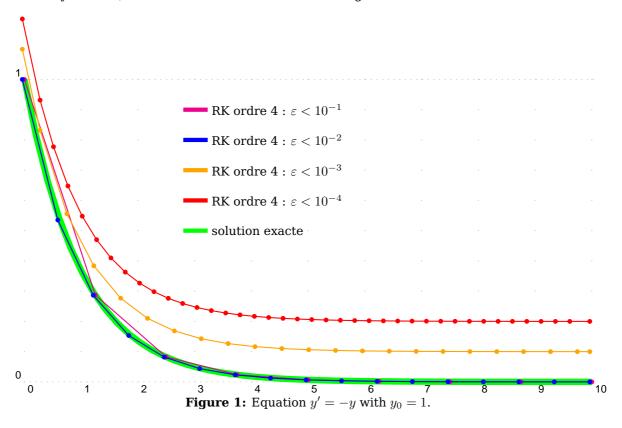

true (default): y is put on the stack element by element, y' must be given in the same way;

false: y is put on the stack as a vector, y' must be returned in the same way;

ullet algebraic: algebraic description for f, buildvector parameter is useless when activating this option.

36.1. Variable step for differential equations

A new algorithm has been added for adjusting the step according to the variations of the curve. The parameter method has a new possible value: varrkiv to activate the Runge-Kutta method with variable step, then the parameter varsteptol (real value; .01 by default) can control the tolerance of the algorithm.

36.2. Equation of second order

Here is the traditional simulation of two stars attracting each other according to the classical gravitation law in $\frac{1}{r^2}$. In 2-Dimensions, the system to be solved is composed of four second order differential equations. In order to be described, each of them gives two first order equations, then we obtain a 8 sized vectorial equation. In the following example the masses of the stars are 1 and 20.

$$\begin{cases} x_1'' = \frac{M_2}{r^2}\cos(\theta) \\ y_1'' = \frac{M_2}{r^2}\sin(\theta) \\ x_2'' = \frac{M_1}{r^2}\cos(\theta) \\ y_2'' = \frac{M_1}{r^2}\sin(\theta) \end{cases} \text{ avec } \begin{cases} r^2 = (x_1 - x_2)^2 + (y_1 - y_2)^2 \\ \cos(\theta) = \frac{(x_1 - x_2)}{r} \\ \sin(\theta) = \frac{(y_1 - y_2)}{r} \end{cases}$$

Table 3: PostScript source code for the gravitational interaction

```

 $\textbf{Figure 5:} \ \ \textbf{Gravitational interaction: landmark defined by one star}$

Simple equation of first order y' = y

For the initial value y(0) = 1 we have the solution $y(x) = e^x$. y is always on the stack, so we have to do nothing. Using the algebraic option, we write it as y[0]. The following example shows different solutions depending to the number of plotpoints with $y_0 = 1$:

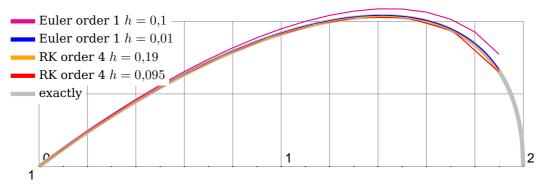

```
\psset{xunit=4, yunit=.4}
  \begin{pspicture}(3,19)\psqrid[subgriddiv=1]
   \psplot[linewidth=6\pslinewidth, linecolor=green]{0}{3}{Euler x exp}
   \psplotDiffEqn[linecolor=magenta,plotpoints=16,algebraic=true]{0}{3}{1}{y
     [0]}
   \psplotDiffEqn[linecolor=blue,plotpoints=151]{0}{3}{1}{}
   \psplotDiffEqn[linecolor=red,method=rk4,plotpoints=15]{0}{3}{1}{}
   \psplotDiffEqn[linecolor=Orange,method=rk4,plotpoints=4]{0}{3}{1}{}
   \psset{linewidth=4\pslinewidth}
   \rput*(0.35,19){\psline[linecolor=magenta](-.75cm,0)}
   \rput*[l](0.35,19){\small Euler order 1 $h=0{,}2$}
   \rput*(0.35,17){\psline[linecolor=blue](-.75cm,0)}
11
   \rule *[1](0.35,17){\small Euler order 1 $h=0{,}02$}
12
   \true_{0.35,15} {\psline[linecolor=0range](-.75cm,0)}
13
   \rput*[l](0.35,15){\small RK ordre 4 $h=1$}
   \rput*(0.35,13){\psline[linecolor=red](-.75cm,0)}
15
   \rput*[l](0.35,13){\small RK ordre 4 $h=0{,}2$}
16
   \rule *(0.35,11) {\psline[linecolor=green](-.75cm,0)}
17
   \rput*[l](0.35,11){\small solution exacte}
 \end{pspicture}
```

$$y' = \frac{2 - ty}{4 - t^2}$$

For the initial value y(0) = 1 the exact solution is $y(x) = \frac{t + \sqrt{4 - t^2}}{2}$. The function f described in PostScript code is like (y is still on the stack):

```
x %% y x
mul %% x*y
2 exch sub %% 2-x*y
4 x dup mul %% 2-x*y 4 x^2
sub %% 2-x*y 4-x^2
div %% (2-x*y)/(4-x^2)
```

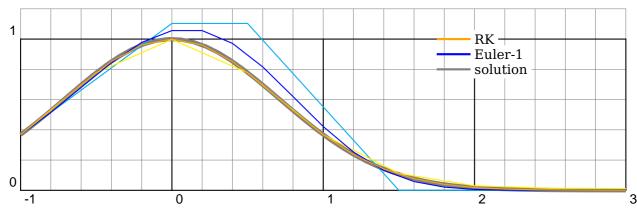

The following example uses $y_0 = 1$.

```
\psset{xunit=6.4, yunit=9.6, showpoints=false}

Lotka-Volterra

The Lotka-Volterra model describes interactions between two species in an ecosystem, a predator and a prey. This represents our first multi-species model. Since we are considering two species, the model will involve two equations, one which describes how the prey population changes and the second which describes how the predator population changes.

For concreteness let us assume that the prey in our model are rabbits, and that the predators are foxes. If we let R(t) and F(t) represent the number of rabbits and foxes, respectively, that are alive at time t, then the Lotka-Volterra model is:

$$\dot{R} = a \cdot R - b \cdot R \cdot F \tag{6}$$

$$\dot{F} = e \cdot b \cdot R \cdot F - c \cdot F \tag{7}$$

where the parameters are defined by:

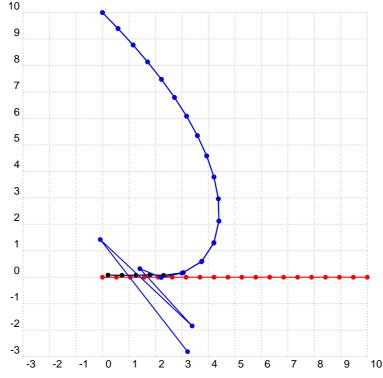

a is the natural growth rate of rabbits in the absence of predation,

 $c\,$ is the natural death rate of foxes in the absence of food (rabbits),

b is the death rate per encounter of rabbits due to predation,

e is the efficiency of turning predated rabbits into foxes.

The Stella model representing the Lotka-Volterra model will be slightly more complex than the single species models we've dealt with before. The main difference is that our model will have two stocks (reservoirs), one for each species. Each species will have its own birth and death rates. In addition, the Lotka-Volterra model involves four parameters rather than two. All told, the Stella representation of the Lotka-Volterra model will use two stocks, four flows, four converters and many connectors.

The mechanical pendulum: $y'' = -\frac{g}{l}\sin(y)$

For small oscillations $\sin(y) \simeq y$:

$$y(x) = y_0 \cos\left(\sqrt{\frac{g}{l}}x\right)$$

The function f is written in PostScript code:

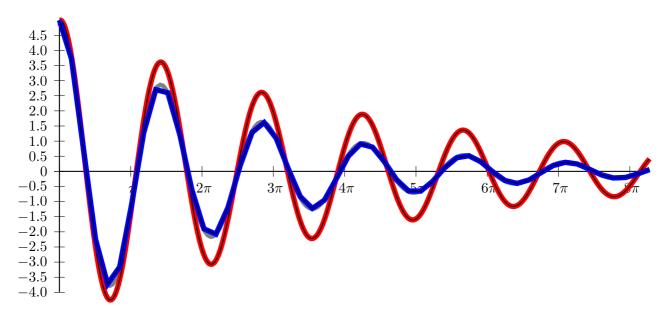

```
exch RadtoDeg sin -9.8 mul % y' -gsin(y)
```

$$y'' = -\frac{y'}{4} - 2y$$

For $y_0 = 5$ and $y'_0 = 0$ the solution is:

$$5e^{-\frac{x}{8}}\left(\cos\left(\omega x\right)+\frac{\sin(\omega x)}{8\omega}
ight) ext{ avec } \omega=\frac{\sqrt{127}}{8}$$

37. \psBoxplot **177**

37. \psBoxplot

A box-and-whisker plot (often called simply a box plot) is a histogram-like method of displaying data, invented by John. Tukey. The box-and-whisker plot is a box with ends at the quartiles Q_1 and Q_3 and has a statistical median M as a horizontal line in the box. The "'whiskers"* are lines to the farthest points that are not outliers (i.e., that are within 3/2 times the interquartile range of Q_1 and Q_3). Then, for every point more than 3/2 times the interquartile range from the end of a box, is a dot.

The only special optional arguments, beside all other which are valid for drawing lines and filling areas, are IQLfactor, barwidth, and arrowlength, where the latter is a factor which is multiplied with the barwidth for the line ends. The IQLfactor, preset to 1.5, defines the area for the outliers.

14 \end{pspicture}
```

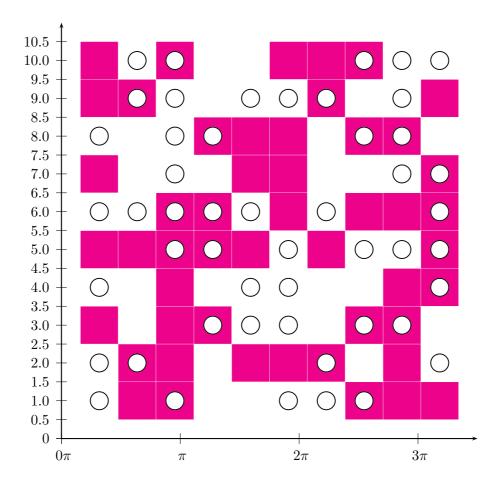

38. \psMatrixPlot

This macro allows you to visualize a matrix. The datafile must be defined as a PostScript matrix named dotmatrix:

Only the value 0 is important, in which case nothing happens, and for all other cases a dot is printed. The syntax of the macro is:

```
\verb|\psMatrixPlot| [Options]| \{rows\} \{columns\} \{data\ file\}
```

The matrix is scanned line by line from the the first one to the last. In general it appears as a bottom-to-top version of the above listed matrix, the first row $0\,1\,1\,0\,0\,0\,1\,1\,1$ is the first plotted line (y=1). With the option ChangeOrder=true it looks exactly like the above view.

```
begin{pspicture}(-0.5,-0.75)(11,11)

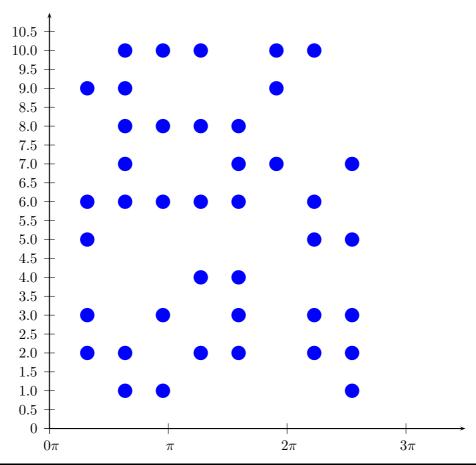

psaxes{->}(11,11)

psMatrixPlot[dotsize=1.1cm,dotstyle=square*,linecolor=magenta]%

{10}{10}{matrix.data}

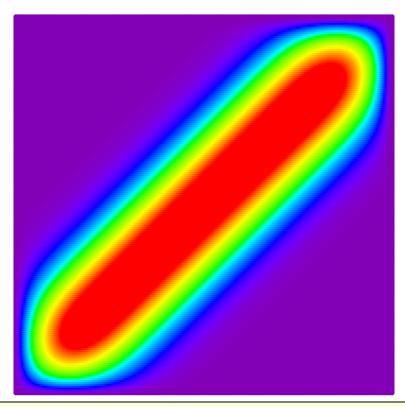

psMatrixPlot[dotsize=.5cm,dotstyle=o,ChangeOrder]{10}{10}{matrix.data}

end{pspicture}
```

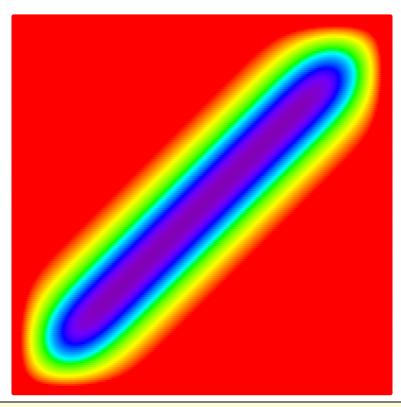

```
\begin{pspicture}(-0.5,-0.75)(11,11)
  \psaxes{->}(11,11)
  \psMatrixPlot[dotscale=3,dotstyle=*,linecolor=blue]{10}{8}{matrix.data}
  \end{pspicture}
```

With the colorType=1 the data is printed as continous color in the range of the wavelength. The smallest value of the data array is set to red and the biggest value is set to violett. All other values are substituted by the corresponding color of the wavlength. colorType=2 ist the same, but vice versa with the color, from violet to red. The following examples uses a 200×200 matrix data, which is saved as /dotmatrix [...] in the file pstricks-add-doc.dat.

\begin{pspicture}(10,10)
 \psMatrixPlot[colorType=1,xStep=0.05,yStep=0.05]{200}{200}{dotmatrix.data}
\end{pspicture}

38. \psMatrixPlot

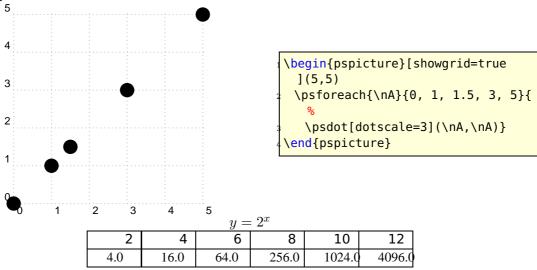

\begin{pspicture}(10,10)
\psMatrixPlot[colorType=2,xStep=0.05,yStep=0.05]{200}{200}{dotmatrix.data}
\end{pspicture}

39. \psforeach and \psForeach

The macro \psforeach allows a loop with an individual increment.

```
\psforeach{variable}{value\ list}{action} \\ psforeach{variable}{value\ list}{action}
```

With \psforeach the *action* is done inside a group and for \psForeach not. This maybe useful when using the macro to create tabular cells, which are alread grouped itself.

```

40. \resetOptions

Sometimes it is difficult to know what options, which are changed inside a long document, are different to the default ones. With this macro all options belonging to pst-plot can be reset. This refers to all options of the packages pstricks, pst-plot and pst-node.

A. PostScript

PostScript uses the stack system and the LIFO system, "'Last In, First Out"'.

Table 5: Some primitive PostScript macros

Function	Meaning	
FullCulon	on stack before $ ightarrow$ after	
add	$x y \rightarrow x + y$	
sub	$x y \rightarrow x - y$	
mul	$x \ y \rightarrow x \times y$	
div	$x \ y \rightarrow x \div y$	
sqrt	$x \to \sqrt{x}$	
abs	$x \rightarrow x $	
neg	$x \rightarrow -x$	
cos	$x o \cos(x)$ (x in degrees)	
sin	$x o \sin(x)$ (x in degrees)	
tan	x o an(x) (x in degrees)	
atan	y x $ o$ $\angle(ec{Ox}; ec{OM})$ (in degrees of $M(x,y)$)	
ln	$x \to \ln(x)$	
log	$x \to \log(x)$	
array	$n \rightarrow v$ (of dimension n)	
aload	$v \rightarrow x_1 x_2 \cdots x_n v$	
astore	$\begin{bmatrix} x_1 & x_2 & \cdots & x_n & v \rightarrow [v] \end{bmatrix}$	
pop	$x \rightarrow -$	
dup	$x \rightarrow x x$
