The kvoptions package

Heiko Oberdiek <oberdiek@uni-freiburg.de>

2009/08/13 v3.4

Abstract

This package is intended for package authors who want to use options in key value format for their package options.

1 Introduction

First I want to recommend the very good review article "A guide to key-value methods" by Joseph Wright [1]. It introduces the different key-value packages and compares them.

1.1 The beginning

This package kvoptions addresses class or package writers that want to allow their users to specify options as key value pairs, e.g.:

\documentclass[verbose=false,name=me]{myclass}
\usepackage[format=print]{mylayout}

Prominent example is package hyperref, probably the first package that offers this service. It's \ProcessOptionsWithKV is often copied und used in other packages, e.g. package helvet that uses this interface for its option scaled.

However copying code is not the most modern software development technique. And hyperref's code for \ProcessOptionsWithKV was changed to fix bugs. The version used in other packages depends on the time of copying and the awareness of hyperref's changes. Now the code is sourced out into this package and available for other package or class writers.

1.2 Overview

Package kvoptions connects package keyval with LATEX's package and class options:

Package keyval	Package kvoptions	ĿTEX kernel
\define@key	\DeclareVoidOption \DeclareStringOption \DeclareBoolOption \DeclareComplementaryOption \DisableKeyvalOption	\DeclareOption
	\DeclareDefaultOption	\DeclareOption*
	\ProcessKeyvalOptions	\ProcessOptions*
	Option patch	Class/package option system
	\SetupKeyvalOptions	

2 Usage

2.1 Process options

2.1.1 \ProcessKeyvalOptions

```
\label{eq:constant} $$\operatorname{ProcessKeyvalOptions} {\langle family \rangle} $$\operatorname{ProcessKeyvalOptions} * $$
```

This command evaluates the global or local options of the package that are defined with keyval's interface within the family $\langle family \rangle$. It acts the same way as LATEX's \ProcessOptions*. In a package unknown global options are ignored, in a class they are added to the unknown option list. The known global options and all local options are passed to keyval's \setkeys command for executing the options. Unknown options are reported to the user by an error.

If the family name happens to be the same as the name of the package or class where \ProcessKeyvalOptions is used or the family name has previously been setup by \SetupKeyvalOptions, then \ProcessKeyvalOptions knows the family name already and you can use the star form without mandatory argument.

2.1.2 \ProcessLocalKeyvalOptions

This macro has the same syntax and works similar as \ProcessKeyvalOptions. However it ignores global options and only processes the local package options. Therefore it only can be used inside a package. An error is thrown, if it is used inside a class.

Neither of the following macros are necessary for \ProcessKeyvalOptions. They just help the package/class author in common tasks.

2.1.3 \SetupKeyvalOptions

```
\SetupKeyvalOptions {
    family = \langle family \rangle,
    prefix = \langle prefix \rangle
}
```

This command allows to configure the default assumptions that are based on the current package or class name. LaTeX remembers this name in \@currname. The syntax description of the default looks a little weird, therefor an example is given for a package or class named foobar.

Key	Default	(example)	Used by
family	$\langle ackslash @ currname angle$	(foobar)	\ProcessKeyvalOptions*
			\DeclareBoolOption
			\DeclareStringOption
prefix	$\langle \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \$	(foobar@)	\DeclareBoolOption
			\DeclareStringOption
			\DeclareVoidOption

2.2 Option declarations

The options for \ProcessKeyvalOptions are defined by keyval's \define@key. Common purposes of such keys are boolean switches, they enable or disable something. Or they store a name or some kind of string in a macro. The following commands help the user. He declares what he wants and kvoptions take care of the key definition, resource allocation and initialization.

In order to avoid name clashes of macro names, internal commands are prefixed. Both the prefix and the family name for the defined keys can be configured by \SetupKeyvalOptions.

2.2.1 \DeclareStringOption

```
\verb|\DeclareStringOption[|\langle init\rangle|] {\langle key\rangle} [\langle default\rangle]|
```

A macro is created that remembers the value of the key $\langle key \rangle$. The name of the macro consists of the option name $\langle key \rangle$ that is prefixed by the prefix (see 2.1.3). The initial contents of the macro can be given by the first optional argument $\langle init \rangle$. The default is empty.

The the option $\langle key \rangle$ is defined. The option code just stores its value in the macro. If the optional argument at the end of \DeclareStringOption is given, then option $\langle key \rangle$ is defined with the default $\langle default \rangle$.

Example for a package with the following two lines:

```
\ProvidesPackage{foobar}
\DeclareStringOption[me]{name}
```

Then \DeclareStringOption defines the macro with content me, note LATEX complains if the name of the macro already exists:

```
\newcommand*{\foobar@name}{me}
```

The option definition is similar to:

```
\define@key{foobar}{name}{%
  \renewcommand*{\foobar@name}{#1}%
}
```

2.2.2 \DeclareBoolOption

```
\DeclareBoolOption [\langle init \rangle] {\langle key \rangle}
```

A boolean switch is generated, initialized by value $\langle init \rangle$ and the corresponding key $\langle key \rangle$ is defined. If the initialization value is not given, false is used as default.

The internal actions of \DeclareBoolOption are shown below. The example is given for a package author who has the following two lines in his package/class:

```
\ProvidesPackage{foobar}
\DeclareBoolOption{verbose}
```

First a new switch is created:

```
\newif\iffoobar@verbose
```

and initialized:

\foobar@verbosefalse

Finally the key is defined:

```
\label{lem:define loss} $$ \operatorname{define lem (foobar) {verbose} [true] {...} $$ $$
```

The option code configures the boolean option in the following way: If the author specifies true or false then the switch is turned on or off respectively. Also the option can be given without explicit value. Then the switch is enabled. Other values are reported as errors.

Now the switch is ready to use in the package/class, e.g.:

```
\iffoobar@verbose
% print verbose message
\else
% be quiet
\fi
```

Users of package \ifthen can use the switch as boolean:

```
\boolean{foobar@verbose}
```

${\bf 2.2.3} \quad \texttt{\ \ } \texttt{DeclareComplementaryOption}$

```
\DeclareComplementaryOption \{\langle key \rangle\} \{\langle parent \rangle\}
```

Sometimes contrasting names are used to characterize the two states of a boolean switch, for example draft vs. final. Both options behave like boolean options but they do not need to different switches, they should share one. $\DeclareComplementaryOption$ allows this. The option $\langle key \rangle$ shares the switch of option $\langle parent \rangle$. Example:

```
\DeclareBoolOption{draft}
\DeclareComplementaryOption{final}{draft}
```

Then final sets the switch of draft to false, and final=false enables the draft switch.

2.2.4 \DeclareVoidOption

```
\DeclareVoidOption\{\langle key \rangle\} \{\langle code \rangle\}
```

\ProcessKeyvalOptions can be extended to recognize options that are declared in traditional way by \DeclareOption. But in case of the error that the user specifies a value, then this option would not recognized as key value option because of \DeclareOption and not detected as traditional option because of the value part. The user would get an unknown option error, difficult to understand.

\DeclareVoidOption solves this problem. It defines the option $\langle key \rangle$ as key value option. If the user specifies a value, a warning is given and the value is ignored.

The code part $\langle code \rangle$ is stored in a macro. The name of the macro consists of the option name $\langle key \rangle$ that is prefixed by the prefix (see 2.1.3). If the option is set, the macro will be executed. During the execution \CurrentOption is available with the current key name.

2.2.5 \DeclareDefaultOption

\DeclareDefaultOption $\{\langle code \rangle\}$

This command does not define a specific key, it is the equivalent to $\mbox{\sc Improved MT}_EX$'s $\mbox{\sc DeclareOption}*$. It allows the specification of a default action $\mbox{\sc code}\mbox{\sc hat}$ is invoked if an unknown option is found. While $\mbox{\sc code}\mbox{\sc hat}$ is called, macro $\mbox{\sc CurrentOption}$ contains the current option string. In addition $\mbox{\sc CurrentOptionValue}$ contains the value part if the option string is parsable as key value pair, otherwise it is $\mbox{\sc relax}$. $\mbox{\sc CurrentOptionKey}$ contains the key of the key value pair, or the whole option string, if it misses the equal sign.

Inside packages typical default actions are to pass unknown options to another package. Or an error message can be thrown by \@unknownoptionerror. This is the original error message that IATEX gives for unknown package options. This error message is easier to understand for the user as the error message from package keyval that is given otherwise.

A Class ignores unknown options and puts them on the unused option list. Let LaTeX do the job and just call \OptionNotUsed. Or the options can be passed to another class that is later loaded.

2.2.6 Local options

```
\label{eq:continuous} $$\DeclareLocalOption {$\langle option \rangle$}$$ $$\DeclareLocalOptions {$\langle option \; list \rangle$}$
```

Both macros mark package options as local options. That means that they are ignored by \ProcessKeyvalOptions if they are given as global options. \DeclareLocalOptions takes one option, \DeclareLocalOptions expects a comma separated list of options.

2.2.7 Dynamic options

Options of LaTeX's package/class system are cleared in \ProcessOptions. They modify the static model of a package. For example, depending on option bookmarks package hyperref loads differently.

Options, however, defined by keyval's \define@key remain defined, if the options are processed by \setkeys. Therefore these options can also be used to model the dynamic behaviour of a package. For example, in hyperref the link colors can be changed everywhere until the end in \end{document}.

However package color that adds color support is necessary and it cannot be loaded after \begin{document}. Option colorlinks that loads color should be active until \begin{document} and die in some way if it is too late for loading packages. With \DisableKeyvalOption the package/class author can specify and configure the death of an option and controls the life period of the option.

2.2.8 \DisableKeyvalOption

```
\DisableKeyvalOption [\langle options \rangle] {\langle family \rangle} {\langle key \rangle}

\langle options \rangle:

action = undef, warning, error, or ignore default: undef global or local default: global package or class = \langle name \rangle
```

\DisableKeyvalOption can be called to mark the end when the option $\langle key \rangle$ is no longer useful. The behaviour of an option after its death can be configured by action:

undef: The option will be undefined, If it is called, \setkeys reports an error because of unknown key.

error or warning: Use of the option will cause an error or warning message. Also these actions require that exclusivly either the package or class name is given in options package or class.

ignore: The use of the option will silently be ignored.

The option's death can be limited to the end of the current group, if option local is given. Default is global.

The package/class author can wish the end of the option already during the package loading, then he will have static behaviour. In case of dynamic options \DisableKeyvalOptions can be executed everywhere, also outside the package. Therefore the family name and the package/class name is usually unknown for \DisableKeyvalOptions. Therefore the argument for the family name is mandatory and for some actions the package/class name must be provided.

Usually a macro would configure the option death, Example:

```
\ProvidesPackage{foobar}
\DeclareBoolOption{color}
\DeclareStringOption[red]{emphcolor}
\ProcessKeyvalOptions*
\newcommand*{\foobar@DisableOption}[2]{%
\DisableKeyvalueOption[
    action={#1},
    package=foobar
  ]{foobar}{#2}%
}
\iffoobar@color
  \RequirePackage{color}
```

```
\renewcommand*{\emph}[1]{\textcolor{\foobar@emphcolor}{#1}}
\else
    % Option emphcolor is not wrong, if we have color support.
    % otherwise the option has no effect, but we don't want to
    % remove it. Therefore action 'ignore' is the best choice:
    \foobar@DisableOption{ignore}{emphcolor}
\fi
% No we don't need the option 'color'.
\foobar@DisableOption{warning}{color}

% With color support option 'emphcolor' will dynamically
% change the color of \emph statements.
```

2.3 Global vs. local options

Options that are given for \documentclass are called global options. They are known to the class and all packages. A package may make use of a global option and marks it as used. The advantage for the user is the freedom to specify options both in the \documentclass or \usepackage commands.

However global options are shared with the class options and options of all other packages. Thus there can be the same option with different semantics for different packages and classes. As example, package bookmark knows option open that specifies whether the bookmarks are opened or closed initially. It's values are true or false. Since KOMA-Script version 3.00 the KOMA classes also introduces option open with values right and any and a complete different meaning.

Such conflicts can be resolved by marking all or part of options as local by \DeclareLocalOption or \DeclareLocalOptions. Then the packages ignores global occurences of these options. Package kvoptions provides two methods:

- \ProcessLocalKeyvalOptions automatically uses all options as local options. It ignores all global options.
- \DeclareLocalOption or \DeclareLocalOptions marks options as local options. \ProcessKeyvalOptions will then ignore global occurences for these local options.

Since version 1.5 package bookmark uses the latter method. It checks global and local option places for driver options and limits all other options as local options. Thus the class option open of KOMA-Script is not misread as option for package bookmark.

2.4 Summary of internal macros

The \Declare...Option commands define macros, additionally to the macros generated by the key definition. These macros can be used by the package/class author. The name of the macros starts with the prefix $\langle prefix \rangle$ that can be configured by \SetupKeyvalOptions.

Declare $\langle key \rangle$	Defined macro	Description
\DeclareStringOption	$ackslash \langle prefix angle \langle key angle$	holds the string
\DeclareBoolOption	$ackslash ext{if} \langle prefix angle \langle key angle$	boolean switch
	$ ackslash \langle prefix angle \langle key angle$ false	disable switch
	$ackslash \langle prefix angle \langle key angle$ true	enable switch
\DeclareComplementaryOption	$ackslash \langle prefix angle \langle key angle$ false	enable parent switch
	$ackslash \langle prefix angle \langle key angle$ true	disable parent switch
\DeclareVoidOption	$ackslash \langle prefix angle \langle key angle$	holds the action

2.5 plain-T_EX

Package keyval is also usable in plain-TEX with the help of file miniltx.tex. Some features of this package kvoptions might also be useful for plain-TEX. If LATEX is not found, \ProcessKeyvalOptions and option patch are disabled. Before using the option declaration commands \Declare...Option, \SetupKeyvalOptions must be used.

3 Example

The following example defined a package that serves some private color management. A boolean option print enables print mode without colors. An option emph redefines \emph to print in the given color. And the driver can be specified by option driver.

```
1 (*example)
2
      % Package identification
 4 \NeedsTeXFormat{LaTeX2e}
5 \ProvidesPackage{example-mycolorsetup}[2009/08/13 Managing my colors]
 7 \RequirePackage{ifpdf}
8 \RequirePackage{kvoptions}
      % Option declarations
10
11
13 \SetupKeyvalOptions{
14
   family=MCS,
    prefix=MCS@
15
16 }
      % Use a shorter family name and prefix
17
18
19
      % Option print
20 \DeclareBoolOption{print}
      % is the same as
22
      % \DeclareBoolOption[false]{print}
23
24
      % Option driver
25 \; \verb|\| ifpdf
   \DeclareStringOption[pdftex]{driver}
27\else
    \DeclareStringOption[dvips]{driver}
28
29 \fi
30
      % Alternative interface for driver options
32 \DeclareVoidOption{dvips}{\SetupDriver}
33 \DeclareVoidOption{dvipdfm}{\SetupDriver}
34 \DeclareVoidOption{pdftex}{\SetupDriver}
35
      % In \SetupDriver we take the current option \CurrentOption
36
      % and pass it to the driver option.
      \mbox{\ensuremath{\mbox{\%}}} The \expandafter commands expand \CurrentOption at the
37
      % time, when \SetupDriver is executed and \CurrentOption
38
      % has the correct meaning.
39
40 \newcommand*{\SetupDriver}{%
    \expandafter\@SetupDriver\expandafter{\CurrentOption}%
41
43 \newcommand*{\@SetupDriver}[1]{%
44
    \setkeys{MCS}{driver={#1}}%
45 }
46
      % Option emph
47
```

```
% An empty value means, we want to have no color for \emph.
48
      % If the user specifies option emph without value, the red is used.
50 \DeclareStringOption{emph}[red]
      % is the same as
      % \DeclareStringOption[]{emph}[red]
52
53
54
      % Default option rule
55 \DeclareDefaultOption{%
56
    \ifx\CurrentOptionValue\relax
      \PackageWarningNoLine{\@currname}{%
57
        Unknown option '\CurrentOption'\MessageBreak
58
        is passed to package 'color'%
59
60
      % Pass the option to package color.
61
      % Again it is better to expand \CurrentOption.
62
      \expandafter\PassOptionsToPackage
63
64
      \expandafter{\CurrentOption}{color}%
65
    \else
      % Package color does not take options with values.
66
67
      % We provide the standard LaTeX error.
68
      \@unknownoptionerror
    \fi
69
70 }
71
72
      % Process options
      % -----
73
74 \ProcessKeyvalOptions*
75
76
      % Implementation depending on option values
77
      % Code for print mode
78
79 \ifMCS@print
80
    \PassOptionsToPackage{monochrome}{color}
81
      \% tells package color to use black and white
82 \fi
83
84 \RequirePackage[\MCS@driver]{color}
85
      % load package color with the correct driver
86
87
      % \emph setup
88 \ifx\MCS@emph\@empty
      \mbox{\%} \@empty is a predefined macro with empty contents.
      % the option value of option emph is empty, thus
90
91
      % we do not want a redefinition of \emph.
92 \else
    \renewcommand*{\emph}[1]{%
      \textcolor{\MCS@emph}{#1}%
95
96 \fi
97 (/example)
```

4 Package options

The package kvoptions knows two package options patch and debugshow. The options of package kvoptions are intended for authors, not for package/class writers. Inside a package it is too late for option patch and debugshow enables some messages that are perhaps useful for the debugging phase. Also LATEX is unhappy if a package is loaded later again with options that are previously not given. Thus package and class authors, stay with \RequirePackage{kvoptions} without options.

Option patch loads package kvoptions-patch.

4.1 Package kvoptions-patch

LATEX's system of package/class options has some severe limitations that especially affects the value part if options are used as pair of key and value.

• Spaces are removed, regardless where:

```
\documentclass[box=0 0 400 600]{article}
```

Now each package will see box=00400600 as global option.

• In the previous case also braces would not help:

```
\documentclass[box={0 0 400 600}]{article}
```

The result is an error message:

```
! LaTeX Error: Missing \begin{document}.
```

As local option, however, it works if the package knows about key value options (By using this package, for example).

• The requirements on robustness are extremly high. IATEX expands the option. All that will not work as environment name will break also as option. Even a \relax will generate an error message:

```
! Missing \endcsname inserted.
```

Of course, LATEX does not use its protecting mechanisms. On contrary protect itself will cause errors.

• The options are expanded. But perhaps the package will do that, because it has to setup some things before? Example hyperref:

```
\usepackage[pdfauthor=M\"uller]{hyperref}
```

Package hyperref does not see M'uller but its expansion and it does not like it, you get many warnings

```
Token not allowed in a PDFDocEncoded string
```

And the title becomes: Mu127uller. Therefore such options must usually be given after package hyperref is loaded:

```
\usepackage{hyperref}
\hypersetup{pdfauthor=Fran\c coise M\"uller}
```

As package option it will even break with Fran\c coise because of the cedilla \c c, it is not robust enough.

For users that do not want with this limitations the package offers option patch. It patches LATEX's option system and tries to teach it also to handle options that are given as pairs of key and value and to prevent expansion. It can already be used at the very beginning, before \documentclass:

```
\RequirePackage[patch] {kvoptions}
\documentclass[pdfauthor=Fran\c coise M\"uller] {article}
\usepackage{hyperref}
```

The latest time is before the package where you want to use problematic values:

```
\usepackage[patch] {kvoptions}
\usepackage[Fran\c coise M\"uller] {hyperref}
```

Some remarks:

- The patch requires ε-T_EX, its \unexpanded feature is much to nice. It is
 possible to work around using token registers. But the code becomes longer,
 slower, more difficult to read and maintain. The package without option
 patch works and will work without ε-T_EX.
- The code for the patch is quite long, there are many test cases. Thus the probability for bugs is probably not too small.

4.2 Option debugshow

The name of this option follows the convention of packages multicol, tabularx, and tracefnt. Currently it prints the setting of boolean options, declared by \DeclareBoolOption in the .log file, if that boolean option is used. You can activate the option by

- \PassOptionsToPackage{debugshow}{kvoptions}

 Put this somewhere before package kvoptions is loaded first, e.g. before \documentclass.
- \RequirePackage[debugshow] {kvoptions}
 Before \documentclass even an author has to use \RequirePackage.
 \usepackage only works after \documentclass.

The preferred method is \PassOptionsToPackage, because it does not force the package loading and does not disturb, if the package is not loaded later at all.

5 Limitations

5.1 Compatibility

5.1.1 Package kvoptions-patch vs. package xkvltxp

Package xkvltxp from the xkeyval project has the same goal as package kvoptions-patch and to patch LATEX's kernel commands in order to get better support for key value options. Of course they cannot be used both. The user must decide, which method he prefers. Package kvoptions-patch aborts itself, if it detects that xkvltxp is already loaded.

However package xkvltxp and kvoptions can be used together, example:

```
\usepackage{xkvltxp}
\usepackage[...]{foobar} % foobar using kvoptions
```

The other way should work, too.

Package kvoptions-patch tries to catch more situations and to be more robust. For example, during the comparison of options it normalizes them by removing spaces around = and the value. Thus the following is not reported as option clash:

```
\RequirePackage{kvoptions-patch}
\documentclass{article}
\usepackage[scaled=0.7]{helvet}
\usepackage[scaled = 0.7]{helvet}
\begin{document}
\end{document}
```

5.2 Limitations

5.2.1 Option comparisons

In some situations LaTeX compares option lists, e.g. option clash check, \@ifpackagewith, or \@ifclasswith. Apart from catcode and sanitizing problems of option patch, there is another problem. LaTeX does not know about the

type and default values of options in key value style. Thus an option clash is reported, even if the key value has the same meaning:

```
\usepackage[scaled]{helvet} % default is .95
\usepackage[.95]{helvet}
\usepackage[0.95]{helvet}
```

5.2.2 Option list parsing with package kvoptions-patch

With package kvoptions-patch the range of possible values in key value specifications is much large, for example the comma can be used, if enclosed in curly braces.

Other packages, especially the packages that uses their own process option code can be surprised to find tokens inside options that they do not expect and errors would be the consequence. To avoid errors the options, especially the unused option list is sanitized. That means the list will only contain tokens with catcode 12 (other) and perhaps spaces (catcode 10). This allows a safe parsing for other packages. But a comma in the value part is no longer protected by curly braces because they have lost their special meaning. This is the price for compatibility.

Example:

```
\RequirePackage{kvoptions-patch}
\documentclass[a={a,b,c},b]{article}
\begin{document}
\end{document}

Result:

LaTeX Warning: Unused global option(s):
    [a={a,c},b].
```

6.2 Option declaration macros

6.2.1 \SetupKeyvalOptions

The family for the key value pairs can be setup once and is remembered later. The package name seems a reasonable default for the family key, if it is not set by the package author.

\KVO@family

We cannot store the family setting in one macro, because the package should be usable for many other packages, too. Thus we remember the family setting in a macro, whose name contains the package name with extension, a key in LATEX's class/package system.

```
230 \define@key{KVO}{family}{%
     \expandafter\edef\csname KVO@family@%
231
232
          \@currname.\@currext\endcsname{#1}%
233 }
234 \ensuremath{\mbox{\mbox{MVO@family}{\%}}}
      \@ifundefined{KVO@family@\@currname.\@currext}{%
235
        \@currname
236
237
     }{%
        \csname KVO@family@\@currname.\@currext\endcsname
238
239
240 }
```

\KVO@prefix

The value settings of options that are declared by \DeclareBoolOption and \DeclareStringOption need to be saved in macros. in the first case this is a switch \if $\langle prefix\rangle\langle key\rangle$, in the latter case a macro \ $\langle prefix\rangle\langle key\rangle$. The prefix can be configured, by prefix that is declared here. The default is the package name with @ appended.

```
241 \define@key{KVO}{prefix}{%
     \expandafter\edef\csname KVO@prefix@%
242
          \@currname.\@currext\endcsname{#1}%
243
244 }
245 \def\KVO@prefix{%
     \@ifundefined{KVO@prefix@\@currname.\@currext}{%
247
       \@currname @%
248
     }{%
       \csname KVO@prefix@\@currname.\@currext\endcsname
249
250
251 }
```

\SetupKeyvalOptions

The argument of \SetupKeyvalOptions expects a key value list, known keys are family and prefix.

```
252 \newcommand*{\SetupKeyvalOptions}{% 253 \setkeys{KVO}% 254 }
```

6.2.2 \DeclareBoolOption

\DeclareBoolOption

Usually options of boolean type can be given by the user without value and this means a setting to true. We follow this convention here. Also it simplifies the user interface.

The switch is created and initialized with *false*. The default setting can be overwritten by the optional argument.

LATEX's \newif does not check for already defined macros, therefore we add this check here to prevent the user from accidently redefining of TeX's primitives and other macros.

```
255 \newcommand*{\DeclareBoolOption}[2][false]{%
     \KVO@ifdefinable{if\KVO@prefix#2}{%
256
        \KVO@ifdefinable{\KVO@prefix#2true}{%
257
          \KVO@ifdefinable{\KVO@prefix#2false}{%
258
            \csname newif\expandafter\endcsname
259
260
            \csname if\KVO@prefix#2\endcsname
261
            \@ifundefined{\KVO@prefix#2#1}{%
262
              \PackageWarning{kvoptions}{%
                Initialization of option '#2' failed,\MessageBreak
263
                cannot set boolean option to '#1', \MessageBreak
264
                use 'true' or 'false', now using 'false'%
265
              }%
266
            }{%
267
              \csname\KVO@prefix#2#1\endcsname
268
            ጉ%
269
            \begingroup
270
              \edef\x{\endgroup
271
272
                \noexpand\define@key{\KVO@family}{#2}[true]{%
                  \noexpand\KVO@boolkey{\@currname}%
                  \ifx\@currext\@clsextension

         }%
283
284
        ጉ%
285
     }%
286 }
```

\DeclareComplementaryOption

The first argument is the key name, the second the key that must be a boolean option with the same current family and prefix. A new switch is not created for the new key, we have already a switch. Instead we define switch setting commands to work on the parent switch.

```
287 \newcommand*{\DeclareComplementaryOption}[2]{%
     \@ifundefined{if\KVO@prefix#2}{%
289
       \PackageError{kvoptions}{%
290
         Cannot generate option code for '#1', \MessageBreak

8 Installation

8.1 Download

Package. This package is available on CTAN¹:

```
CTAN:macros/latex/contrib/oberdiek/kvoptions.dtx The source file.
```

CTAN:macros/latex/contrib/oberdiek/kvoptions.pdf Documentation.

Bundle. All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

```
CTAN:install/macros/latex/contrib/oberdiek.tds.zip
```

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

8.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

8.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain-T_EX:

```
tex kvoptions.dtx
```

¹ftp://ftp.ctan.org/tex-archive/

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

8.4 Refresh file name databases

If your T_EX distribution (te T_EX , mik T_EX , ...) relies on file name databases, you must refresh these. For example, te T_EX users run texhash or mktexlsr.

8.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the .dtx source file. It can be extracted by AcrobatReader 6 or higher. Another option is pdftk, e.g. unpack the file into the current directory:

```
pdftk kvoptions.pdf unpack_files output .
```

Unpacking with LATEX. The .dtx chooses its action depending on the format:

plain-TEX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using LATEX for docstrip (really, docstrip does not need LATEX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{kvoptions.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfIATEX:

```
pdflatex kvoptions.dtx
makeindex -s gind.ist kvoptions.idx
pdflatex kvoptions.dtx
makeindex -s gind.ist kvoptions.idx
pdflatex kvoptions.dtx
```

10 History

[0000/00/00 v0.0]

• Probably David Carlisle's code in hyperref was the start.

[2004/02/22 v1.0]

• The first version was never published. It also has offered a patch to get rid of LATEX's option expansion.

[2006/02/16 v2.0]

- Now the package is redesigned with an easier user interface.
- \ProcessKeyvalOptions remains the central service, inherited from hyperref's \ProcessOptionsWithKV. Now the use inside classes is also supported.
- Provides help macros for boolean and simple string options.
- Fixes for the patch of LATEX. The patch is only enabled, if the user requests it.

[2006/02/20 v2.1]

- Unused option list is sanitized to prevent problems with other packages that uses own processing methods for key value options. Disadvantage: the unused global option detection is weakened.
- New option type by \DeclareVoidOption for options without value.
- Default rule by \DeclareDefaultOption.
- Dynamic options: \DisableKeyvalOption.

[2006/06/01 v2.2]

• Fixes for option patch.

[2006/08/17 v2.3]

• \DeclareBooleanOption renamed to \DeclareBoolOption to avoid a name clash with package \ifoption.

[2006/08/22 v2.4]

• Option patch: \ExecuteOptions does not change the meaning of macro \CurrentOption at all.

[2007/04/11 v2.5]

• Line ends sanitized.

[2007/05/06 v2.6]

• Uses package etexcmds.

[2007/06/11 v2.7]

• The patch part fixes LaTeX bug latex/3965.

[2007/10/02 v2.8]

- Compatibility for plain-TeX added.
- Typos in documentation fixed (Axel Sommerfeldt).

[2007/10/11 v2.9]

• Bug fix for option patch.

[2007/10/18 v3.0]

• New package kvoptions-patch.

[2009/04/10 v3.1]

• Space by line end removed in definition of internal macro.

[2009/07/17 v3.2]

- \ProcessLocalKeyvalOptions added.
- \DisableKeyvalOption with the action=ignore option fixed (Joseph Wright).

[2009/07/21 v3.3]

• \DeclareLocalOption, \DeclareLocalOptions added.

[2009/08/13 v3.4]

- Documentation addition: recommendation for Joseph Wright's review article.
- Documentation addition: local/global options.
