The svn-prov package

Use SVN Id keywords for package, class and file header

Martin Scharrer martin@scharrer-online.de

Version v1.1049 - 2009/05/03

1 Introduction

This package is directed to authors of LATEX packages and classes which use the version control software Subversion¹ (SVN) for their source files. It introduces three macros which are Subversion variants of the standard LATEX header macros \ProvidesPackage, \ProvidesClass and \ProvidesFile which are used to identify package, class and other files, respectively. Instead of providing the package/class/file name and date manually they are extracted from a Subversion Id keywords string which is updated automatically by every time the source file is committed to the repository.

A similar package exists for RCS, the pre-predecessor of Subversion, in the pgf² bundle which is called pgfrcs. For further support for Subversion keywords see the author's other package svn-multi³.

2 Usage

The following macros need an Id keyword which can initially be written as '\$Id:\$' and will be expanded by Subversion into the following format at the next commit:

```
Gid: \langle filename \rangle \langle revision \rangle \langle date \rangle \langle time \rangle \langle author \rangle  e.g. for the source file of this document:
```

\$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin \$

For this to work the Subversion *property* svn:keywords must be set to (at least) 'Id' for the source file(s). e.g. using the command line:

```
svn propset 'svn:keyword' 'Id' \langle filename(s) \rangle
```

More information about using Subversion in the LATEX workflow can be found in the PracTEX Journal issue 2007-3⁴.

¹WWW: http://subversion.tigris.org/

²CTAN: http://tug.ctan.org/pkg/pgf

³CTAN: http://tug.ctan.org/pkg/svn-multi

 $^{^4\}mathrm{URL}$: http://www.tug.org/pracjourn/2007-3/{skiadas-svn|ziegenhagen|scharrer}

```
\label{eq:condition} $$ \Pr ovides Package SVN [$ file name $ ] {$Id: ... $} [$ Package Information (version, description) $ ] $$ \Pr ovides Class SVN [$ file name $ ] {$Id: ... $} [$ Class Information (version, description) $ ] $$ Provides File SVN [$ file name $ ] {$Id: ... $} [$ File Information (version, description) $ ].
```

All of these macros await a valid Subversion Id keyword string as a mandatory argument. The file name and date is extracted from this string. For cases when the file source is not stored in the correct file but packed inside a different one, like a .dtx file, the correct file name can be provided by an optional argument. Because the file extension of package and class files is predefined and therefore ignored this is not needed for them when they are packed inside a corresponding .dtx file, i.e. one with the same base name.

As with the standard macros mentioned above an optional argument can be given afterwards which contains additional information (date, version, description) of the package, class or file. However, the SVN macros automatically insert the date, so only a version number and a short description should be given. If this argument is not given a default information string is used which is shown below as \revinfo.

Both optional arguments can include the following macros which are only valid inside them, but not afterwards:

\rev File revision.

\Rev File revision followed by a space.

\revinfo The default information used: "(SVN Rev: \(revision \))".

\filebase File base name (file name without extension).

\fileext File extension (without leading dot).

\filename File name.

\filedate File date (in the format YYYY/MM/DD).

\filerev File revision, like \rev.

\GetFileInfoSVN*

The star version of this macro provides the file information of the last file which called one of the \Provides...SVN macros. It is meant to be used inside a .dtx file directly after the provide macro so that the file information can be typeset inside the documentation.

A 'normal', non-star version is not yet implemented.

The provided information macros are \filebase, \fileext, \filename, \filedate, \filerev and \fileinfo. The last one contains the file description, e.g. the content of the optional argument without date and version. The other macros were already described earlier.

\DefineFileInfoSVN[$\langle name \rangle$]

New in v1. 2009/05/03

Defines a set of macros which provide the information collected by a previous $\Provides...$ macro. The macros have the form $\alpha (name) \ensuremath{@} (data)$ where $\alpha name)$ is by default the filename either with the file extension (general files) or without

(packages and classes). This default can be overwritten by the optional argument. The $\langle data \rangle$ stands for version, rev (revision), date and info (the information part without the version number).

Example: Applied to the .dtx file of this very package the following macros are defined:

| Macro | Definition |
|-----------------------|----------------------|
| \svn-prov.dtx@version | v1.1049 |
| \svn-prov.dtx@rev | 1049 |
| \svn-prov.dtx@date | 2009/05/03 |
| \svn-prov.dtx@info | DTX for svn-prov.sty |

The style file however would get macros like \svn-prov@version. Because '-' is not a letter the macros can only be accessed using \csname. Therefore the optional argument [svnprov] is used to name the macros \svnprov@version etc..

3 Examples

The following examples illustrate the usage of the provided macros and how they call the equivalent standard macros internally. The example *results* are produced by expanding the corresponding example *code* while the standard provide macros are locally redefined to typeset their own name and arguments in verbatim style. This does not only simplifies the generation of this document but makes this examples also test cases which allow the package author to test the result of the defined macros.

While mostly the package macro is used here the usage is identical to the class and file macros. Of course before this macros are used it must be made sure that the svn-prov package is loaded which is done by using the following code direct before them:

\RequirePackage{svn-prov}

Minimal usage

The following code:

is equivalent to:

\ProvidesPackage{svn-prov}[2009/05/03 (SVN Rev: 1049)]

The following code:

```
is equivalent to:
\ProvidesClass{svn-prov}[2009/05/03 (SVN Rev: 1049)]
The following code:
\ProvidesFileSVN
  {$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
is equivalent to:
\ProvidesFile{svn-prov.dtx}[2009/05/03 (SVN Rev: 1049)]
Normal Usage
The following code:
\ProvidesPackageSVN
  {$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
  [v1.0 Example Description]
is equivalent to:
\ProvidesPackage{svn-prov}[2009/05/03 v1.0 Example Description]
The following code:
\ProvidesClassSVN
  {$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
  [v1.0 Example Description]
is equivalent to:
\ProvidesClass{svn-prov}[2009/05/03 v1.0 Example Description]
The following code:
\ProvidesFileSVN
  {$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
  [v1.0 Example Description]
is equivalent to:
```

\ProvidesFile{svn-prov.dtx}[2009/05/03 v1.0 Example Description]

Overwriting Name

```
The following code:
```

```
\ProvidesPackageSVN[othername]
{$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
[v1.0 Example Description]
```

is equivalent to:

\ProvidesPackage{othername}[2009/05/03 v1.0 Example Description]

Overwriting Name including unneeded Extension

The following code:

```
\ProvidesPackageSVN[othername.sty]
{$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
[v1.0 Example Description]
```

is equivalent to:

\ProvidesPackage{othername}[2009/05/03 v1.0 Example Description]

Overwriting Name using Macros

The following code:

```
\ProvidesFileSVN[\filebase.cfg]
  {$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
  [v1.0 Example Description]
```

is equivalent to:

\ProvidesFile{svn-prov.cfg}[2009/05/03 v1.0 Example Description]

Using Macros in File Information String

The following code:

```
\ProvidesPackageSVN
{$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
[v1.\Rev Example Description]
```

is equivalent to:

\ProvidesPackage{svn-prov}[2009/05/03 v1.1049 Example Description]

Adding Text to Default Information

```
The following code:
```

```
\ProvidesPackageSVN
  {$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
  [v1.\Rev Extra Text \revinfo]

is equivalent to:
\ProvidesPackage{svn-prov}[2009/05/03 v1.1049 Extra Text (SVN Rev: 1049)]
```

Getting the File Information

The following code:

```
\ProvidesPackageSVN
  {$Id: svn-prov.dtx 1049 2009-05-03 00:24:49Z martin $}
  [v1.\Rev Extra Text \revinfo]
\GetFileInfoSVN*
& \filename
                                 11
  File Name
  File Base Name & \filebase
                                 11
  File Extension & \fileext
                                 11
  File Date & \filedate
                                 //
  File Revision & \filerev
                                 11
                 & \fileversion \\
  File Version
  File Info
                 & \fileinfo
\end{tabular}
results in:
 File Name
            : svn-prov.dtx
File Base Name : svn-prov
File Extension : dtx
 File Date
            : 2009/05/03
 File Revision : 1049
 File Version
            : v1.1049
 File Info
            : Extra Text (SVN Rev: 1049)
```

The correct package file extension '.sty' for \fileext can be forced by using [\filebase.sty] as a first optional argument.

Implementation

1 \NeedsTeXFormat{LaTeX2e}[1999/12/01]

\ProvidesClassSVN

Calls the generic macro with the original LaTeX macro and the string to be used as filename.

- 2 \def\ProvidesClassSVN{%
- \svnprov@generic\ProvidesClass{\svnprov@filebase}%

4 }

\ProvidesFileSVN

Calls the generic macro with the original LaTeX macro and the string to be used as filename.

- 5 \def\ProvidesFileSVN{%
- \svnprov@generic\ProvidesFile{\svnprov@filebase.\svnprov@fileext}%

\ProvidesPackageSVN

Calls the generic macro with the original LaTeX macro and the string to be used as filename.

- 8 \def\ProvidesPackageSVN{%
- \svnprov@generic\ProvidesPackage{\svnprov@filebase}%

10 }

\svnprov@generic

Stores the arguments (1: original macro, 2: file mask (full filename of only base is used?)). Then tests if a explicit file name was given as optional argument. If not the file name from the SVN Id string is used.

- 11 \def\svnprov@generic#1#2{%
- \def\svnprov@ltxprov{#1}% 12
- \def\svnprov@filemask{#2}% 13
- \@ifnextchar{[}% 14
- {\svnprov@getid}% 15
- {\svnprov@getid[\svnprov@svnfilename]}% 16

17 }

\svnprov@generic

Saves first argument as filename and calls the scan macro with the second. A fall-back string is provided to avoid T_FX parsing errors.

- 18 \def\svnprov@getid[#1]#2{%
- \def\svnprov@filename{#1}% 19
- \svnprov@scanid #2\relax \$% 20
- Id: unknown.xxx 0 0000-00-00 00:00:00Z user \$\svnprov@endmarker 21 22 }

\svnprov@scanid Parses the Id string and tests if it is correct (#1=empty, #8=\relax). If correct the values are stored in macros and the next macro is called. Otherwise a warning message is printed. In both cases any remaining text of the parsing procedure is gobbled before the next step.

- 23 \def\svnprov@scanid#1\$%
- 24 Id: #2 #3 #4-#5-#6 #7 \$#8{%
- 25 \def\next{%
- \PackageWarning{svn-prov}{Did not found valid SVN Id line in file

```
'#2'.}{}{}{}%
27
       \svnprov@gobbleopt
28
    }%
29
    \int {\pi \pi} = \pi \pi
30
       \ifx\relax#8\empty
31
32
         \def\svnprov@svnfilename{#2}%
33
         \svnprov@splitfilename{#2}%
         \def\svnprov@filerev{#3}%
34
         \def\svnprov@filedate{#4/#5/#6}%
35
         \def\next{\svnprov@buildstring}%
36
37
38
    \fi
39
    \expandafter\next\svnprov@gobblerest
40 }% $
```

\svnprov@splitfilename

Expands the argument and initialises the file base macro before it calls the next macro with the expanded argument and a dot to protect for TEX parsing errors. The \relax is used as end marker.

```
41 \def\svnprov@splitfilename#1{%
42 \edef\g@tempa{#1}%
43 \let\svnprov@filebase\@gobble
44 \expandafter
45 \svnprov@splitfilename@\g@tempa.\relax
46 }
```

\svnprov@splitfilename@

The second argument is tested if it is empty (end of file name reached). If not empty the first argument is concatenated to the file base macro and the macro calls itself on the second argument. This ensures correct handling of file name which contain multiple dots.

If the second argument was empty it is tested if the file base name is still in its initialised state which means that there is no file extension. Then the file base is defined to the first argument and the extension as empty. Otherwise the file extension is defined to the first argument and the file base macro is unchanged because it is already correct.

```
47 \def\svnprov@splitfilename@#1.#2\relax{%
48
    \if&#2&
       \ifx\svnprov@filebase\@gobble
49
         \gdef\svnprov@filebase{#1}%
50
         \gdef\svnprov@fileext{}%
51
      \else
52
        \gdef\svnprov@fileext{#1}%
53
54
      \let\next\relax
55
    \else
56
       \xdef\svnprov@filebase{\svnprov@filebase.#1}%
57
      \def\next{\svnprov@splitfilename@#2\relax}%
58
    \fi
59
60
    \next
61 }
```

Simply gobbles everything up to the next endmarker. \svnprov@gobblerest 62 \def\svnprov@gobblerest#1\svnprov@endmarker{} This is the end marker which should never be expanded. However it gets defined \svnprov@endmarker and set to an unique definition which will gobble itself if ever expanded. 63 \def\svnprov@endmarker{\@gobble{svn-prov endmarker}} \svnprov@gobbleopt Gobbles an optional argument if present. 64 \newcommand*\svnprov@gobbleopt[1][]{} \svnprov@defaultdesc Default description text to be used. Does not include the file date which is prepended later. 65 \def\svnprov@defaultdesc{% (SVN Rev:\space\svnprov@filerev)% 67 } First aliases the internal macro to user-friendly names and then builds the info \svnprov@buildstring string. Finally the stored original LaTeX macro is called with the filename and information. 68 \newcommand*\svnprov@buildstring[1][\svnprov@defaultdesc]{% \begingroup 69 \let\rev\svnprov@filerev 70 \let\filerev\svnprov@filerev 71 \def\Rev{\rev\space}% 72 \let\revinfo\svnprov@defaultdesc 73 \let\filebase\svnprov@filebase 74 75 \let\fileext\svnprov@fileext 76 \ifx\fileversion\@undefined \def\fileversion{v0.0}% 77 \fi 78 \edef\filename{\filebase.\fileext}% 79

\xdef\svnprov@filename{\svnprov@filename}%

\svnprov@splitfilename{\svnprov@filename}%

\ifx\svnprov@filename\filename\else

\let\filename\svnprov@filename

\xdef\svnprov@fileinfo{#1}%

 $\verb|\GetFileInfoSVN||$

80

81

82 83

84

85 86

87 88 } \endgroup

At the moment this macro **must** be called with a star '*' which indicated that the current file is to be used. Other arguments are not implemented yet.

\svnprov@ltxprov{\svnprov@filemask}[\svnprov@filedate\space\svnprov@fileinfo]%

The macro provides the file information of "the current file", i.e. the last file which called one of the above **\Provides...** macros. For this the internal macros are simply copied to user-friendly names.

This macro is inspired by the macro $\GetFileInfo\{\langle file\ name \rangle\}\$ from the doc package.

```
89 \def\GetFileInfoSVN#1{%
                          90
                            \let\filebase\svnprov@filebase
                      91
                             \let\fileext\svnprov@fileext
                      92
                             \let\filename\svnprov@filename
                      93
                      94
                             \let\filedate\svnprov@filedate
                      95
                             \let\filerev\svnprov@filerev
                      96
                             \expandafter\svnprov@getversion
                             \svnprov@fileinfo\relax{} \relax\svnprov@endmarker
                      97
                             \let\fileversion\svnprov@fileversion
                      98
                            \let\fileinfo\svnprov@fileinfoonly
                      99
                     100
                            \PackageError{svn-prov}{Macro \textbackslash GetFileInfoSVN without '*' is
                     101
                            not implemented yet.}{}{}{}%
                     102
                     103
                     104 }
 \DefineFileInfoSVN Defines macros in the form \langle filename \rangle @\langle xxx \rangle, where \langle xxx \rangle is date, version,
                      rev(ision) and info.
                     105 \newcommand*\DefineFileInfoSVN[1][\svnprov@filemask]{%
                     106
                          \expandafter\svnprov@getversion
                          \svnprov@fileinfo\relax{} \relax\svnprov@endmarker
                     107
