The `cleveref` package[*]

Toby Cubitt

`toby-cleveref@dr-qubit.org`

22/09/2009

Abstract

The `cleveref` package enhances LATEX's cross-referencing features, allowing the format of cross-references to be determined automatically according to the "type" of cross-reference (equation, section, etc.) and the context in which the cross-reference is used. The formatting for each cross-reference type can be fully customised in the preamble of your document. In addition, `cleveref` can type-set cross-references to lists of multiple labels, automatically formatting them according to their types, sorting them, and compressing sequences of numerically consecutive labels. Again, the multiple-reference formatting is fully customisable.

Contents

---

[*]This document corresponds to `cleveref` 0.14.2, dated 22/09/2009.

1 Introduction

When "clever" is used in the name of a computer program, it usually signifies that the programmer is overly smug about his achievements! On the other hand, at the heart of the LaTeX philosophy is the idea that it is clever to delegate as much of the typesetting as possible to the computer, in order to achieve a beautiful, but above all consistent, visual appearance.

Both these points of view are probably valid when it comes to the `cleveref` package. Its goals are two-fold: to use the information that LaTeX inherently has about labels as intelligently as possible when type-setting cross-references to them (clever processing); and to enable you to produce an attractive, consistent formatting of cross-references throughout your document, with the minimum of effort (you'd be clever to use it!).

The `cleveref` package enhances LaTeX's cross-referencing facilities by allowing cross-references to be formatted automatically according to the type of thing they refer to (chapter, section, equation, theorem, etc.) and the context in which the cross-reference is used. It can also automatically format cross-references to multiple labels, sort lists of multiple cross-references, compres cross-references to consecutive labels into a reference range, and all kinds of other clever wizardry.

In standard LaTeX, you have almost certainly found yourself writing things like `Eq.~(\ref{eq1})` and `Theorems~\ref{thm1} to~\ref{thm3}` over and over again. Tedium isn't the only downside to this. What happens if you later decide you want equation references to be type-set as `Equation~\ref{eq1}` instead? What happens if you decide to change the theorem labelled `thm1` into a lemma? You have to search through the entire LaTeX source of your document, modifying all references to equations, and changing all references to `thm1`.

The `cleveref` package allows you to define the format for cross-references once-and-for-all in the preamble of your document. If you later decide to change the format of equation references, you only have to change one preamble definition. If you change a theorem into a lemma, you don't need to change any cross-references at all, because `cleveref` will automatically type-set cross-references to it using the appropriate formatting. This makes it far easier to type-set cross-references uniformly across your whole document, as well as avoiding repetitively typing the same text for each and every cross-reference.

Given how useful this is, there are naturally a number of other packages with similar goals, most notably `varioref`, `fancyref`, `hyperref`'s `\autoref` command, and (for theorem-like environments) `ntheorem` (with the `thref` option). (There are many others, but these come closest to providing similar features to `cleveref`.) However, all have certain deficiencies which `cleveref` attempts to overcome.

The `fancyref` package doesn't automatically determine the type of thing being referred to. Instead, it relies on you adhering to a naming convention for labels. This is usually a good idea in any case, but it can be inconvenient. For example, if you change a theorem into a lemma, you have to change the label name, and therefore also all cross-references to it. So you are back to searching and replacing through the entire document, not to mention missing out on all the other `cleveref` features.

The enhanced referencing feature provided by the `varioref` package's `\labelformat` command decides how to format cross-references when the label is *defined*, rather than when it is *referenced*. Often this isn't a problem. But it makes it impossible to format cross-references differently according the context in which they are referenced, which can sometimes be very useful. For example, if you want cross-references at the beginning of a sentence formatted any other way than by capitalising the first letter of the cross-reference text, it is impossible using `varioref`. Perhaps even more significantly, it makes it impossible to type-set multiple references automatically; you are back to typing `Eqs.~(\ref{eq1}) to~(\ref{eq3})` by hand. Not to mention missing out on automatic sorting and compressing of consecutive references, `ntheorem` support, precise control over hyper-links, etc. `cleveref` fully supports `varioref`, taking over responsibility for type-setting cross-references, whilst retaining all the `varioref` page-referencing magic.

The `hyperref` package's `\autoref` command type-sets a name before a cross-reference, determined by the cross-reference type. This is less flexible than `cleveref`'s fully customisable cross-reference formatting but, when combined with `varioref`, the two packages working together come close. However, even with `hyperref`, it is impossible to customise precisely which part of the cross-reference is made into a hyper-link in PDF documents; this is very easy with `cleveref`. And it still remains impossible to type-set multiple references, have consecutive references sorted and compressed automatically, etc.

The `ntheorem` package (with the `thref` option) does things right with regards how and when the format is defined...except that it only works for theorem-like environments. It is possible to use it for other environments, but only in a bastardized form, by manually supplying an optional argument to `\label` commands that specifies the label type. `cleveref` works equally well when referencing any type of thing, as well as fully supporting `ntheorem`. And again, `cleveref` also provides a number additional features over `ntheorem`, such as multiple cross-references, automatic sorting and compressing of consecutive cross-references, control over the placement of hyper-links, etc.

2 Usage

The `cleveref` package is loaded in the usual way, by putting the line

    \usepackage{cleveref}

in your document's preamble. However, care must be taken when using `cleveref` in conjunction with other packages that modify LaTeX's referencing system (see section 9). Basically, `cleveref` must be loaded *last*.

If you just want to get going quickly with `cleveref`, and come back later to read up on all the features it provides in more detail, here's what you need to do. Wherever you would previously have used `\ref`, use `\cref` instead. (Except at the beginning of a sentence, where you should use `\Cref`.) You no longer need to put the name of the thing you're referencing in front

of the `\cref` command, because `cleveref` will sort that out for you: i.e. use `\cref{eq1}` instead of eq.~(`\ref{eq1}`). If you want to refer to a range of labels, use the `\crefrange` command: `\crefrange{eq1}{eq5}` gives `eqs.~(1) to~(5)`. Finally, if you want to refer to multiple things at once, you can now combine them all into one cross-reference and leave `cleveref` to sort it out: e.g. `\cref{eq2,eq1,eq3,eq5,thm2,def1}` produces: `eqs.~(1) to~(3) and~(5), theorem~5, and definition~1`.

3   Type-Setting Cross-References

`\cref`   To automatically type-set a cross-reference according to the type of thing referred to, simply refer to it using `\cref{⟨label⟩}`. `cleveref` imposes just one extra restriction on the names of labels: they are no longer allowed to contain commas ",". These are instead used to type-set multiple cross-references (see below).

`\Cref`   As it is very difficult[1] for LaTeX to determine whether a cross-reference appears at the beginning of a sentence or not, a beginning-of-sentence variant exists: `\Cref{⟨label⟩}`. By default, this type-sets the cross-reference with the first letter capitalised, and without using an abbreviation in those cases where the standard variant does use one. (However, the formatting of the `\cref` and `\Cref` forms can be fully and independently customised, see section 6.)

`\ref`   `cleveref` does *not* modify the standard `\ref` command[2], so you can still use it to type-set the formatted label counter alone, without any additional text or formatting.

`\crefrange`   To type-set a cross-reference range, e.g. `Eqs.~(1.1) to~(1.5)`, use
`\Crefrange`   `\crefrange` or `\Crefrange` (depending on the capitalisation you require), which take the beginning and end of the range as arguments:

$$\texttt{\textbackslash crefrange\{⟨label1⟩\}\{⟨label2⟩\}}$$

`\cref`   To type-set multiple cross-references, simply list the lables inside the `\cref` or
`\Cref`   `\Cref` command, separated by commas (you are not allowed to use commas in label names when using `cleveref`):

$$\texttt{\textbackslash cref\{⟨label1⟩,⟨label2⟩,⟨label3⟩,...\}}$$

`\cref*`   When `cleveref` is used along with the `hyperref` package (see sections 6 and 9),
`\Cref*`   additional starred variants of all the referencing commands are available. The
`\crefrange*`   standard referencing commands will make cross-references into hyper-links; the
`\Crefrange*`   starred variants prevent this, producing the same type-set text but without creating hyper-links.

---

[1] Actually, very likely impossible!

[2] This is not quite true. The original `\ref` command no longer works when `cleveref` is loaded, so `cleveref` redefines it to recover the original behaviour.

5

4 Sorting and Compressing

When `cleveref` type-sets lists of multiple cross-references, the default behaviour is to automatically sort the list and compress sequences of consecutive cross-references into a reference range. You can change this behaviour by supplying one of the following package options:

`sort` Sort lists of cross-references, but don't compress consecutive references.

`compress` Compress sequences of consecutive references into a reference range, but don't sort the list of cross-references.

`nosort` Neither sort lists of cross-references, *nor* compress consecutive references.

`sort&compress` Sort lists of cross-references, and compress sequences of consecutive references into a reference range (this is the default).

Occasionally, you may want to prevent a particular sequence of consecutive cross-references from being compressed to a reference range, without disabling this feature globally. To achieve this, you can separate the cross-references in the list by one or more empty references, at the point at which you want to prevent compression. For example,

    \cref{eq1,eq2,eq3,,eq4}

will be type-set as

    eqs. (1) to (3) and (4)

or

    \cref{eq1,eq2,,eq3,eq4,eq5,,eq6,eq7,eq8}

will be type-set as

    eqs. (1), (2), (3) to (5) and (6) to (8)

You can safely put an empty reference between cross-references that would never be compressed anyway; it will simply be ignored.

If lists of cross-references are also being sorted (the default), it can be a little confusing to work out where the empty reference should go in order to prevent compression of a particular consecutive sequence. It's best to think of the empty reference as being "attached" to the cross-reference preceding it. When the list is sorted, the empty reference will still appear after the same preceding reference, and will prevent it being compressed with any subsequent consecutive cross-references. In other words, an empty reference ensures that the preceding reference will appear explicitly in the final, type-set cross-reference:

    \cref{eq3,,eq2,eq1,eq6,eq4,eq5}

will be type-set as

    eqs. (1) to (3) and (4) to (6)

5   Capitalising All Cross-Reference Names

`capitalise`   Many authors prefer to always capitalise cross-reference names, regardless of where they appear in the sentence, writing Theorem 1 and Equation 3 (as opposed to theorem 1 and equation 3). If you count yourself among this group, you can pass the `capitalise` option to the `cleveref` package (`capitalize` also works).

All the default cross-reference formats will then have the first letter capitalised, as will the automatically generated `\cref` variants (see sections 6.1.2 and 6.2). (However, if you explicitly define a `\cref` variant to *not* be capitalised, `cleveref` will still honour your definition. In other words, you're responsible for defining the capitalisation correctly in your own format definitions.)

You should *still* use the `\Cref` variants at the beginning of sentences, for one thing, because abbreviations should not be used at the beginning of a sentence[3], and for another, in case you later change your mind and remove the `capitalise` option.

6   Customising the Cross-Reference Format

The `cleveref` package allows you to take full control of the type-setting of cross-references, by allowing the formatting to be customised. Defaults appropriate for English documents are provided for the standard label types[4], and support for German, French, Spanish and Italian is provided via package options (see section 6.3). But if you don't like the defaults, or are writing in a different language[5], or you need to refer to something for which no default format is defined, then you can take charge and define your own formats.

If `cleveref` encounters a cross-reference to a type it does not know, it will produce a "reference type undefined" warning, and type-set the cross-reference as

> **??** `\ref{⟨label⟩}`

i.e. the label counter preceded by a double question mark. The error message indicates the name of the unknown cross-reference type, which you will then probably want to define. (References to undefined labels still produce a "reference undefined" warning and appear as a double question mark, as usual.)

The cross-reference formats are usually constructed out of components: the cross-reference name (different for each type of cross-reference), the format for the label itself, and the conjunctions used in reference ranges and lists of multiple cross-references. There are two levels of customisation: you can either customise the components, or you can take full control and override the component-derived format entirely.

---

[3] At least in English; I'm not sure about other languages.

[4] For any pedantic classics scholars out there: "lemmas" is recognised as a valid plural form of "lemma" in all current versions of the Oxford English Dictionary. "Lemmata" was last heard in a mathematical debate that took place in a pub just around the corner from Hadrian's wall. . . a few years before the Romans pulled out of Britain. `cleveref` might have "clever" in its name, but even that doesn't make it pretentious enough to use "lemmata".

[5] Any contributions of translations for missing languages are very welcome! See section 11.11 for information on how to contribute translations.

6.1 Customising the Cross-Reference Components

6.1.1 Global Customisation

The global customisation commands affect all cross-reference formats, unless they are overridden by lower-level customisation commands.

\crefdefaultlabelformat   The format for the label counter itself can be customised globally using

$$\crefdefaultlabelformat\{\langle format\rangle\}$$

The ⟨*format*⟩ argument can be any valid LaTeX code, though you will need to \protect fragile commands. It can (and almost certainly should!) contain three arguments, #1, #2 and #3. The first argument is the formatted version of the label counter (e.g. \theequation). The other two are used to mark the beginning and end of the part of the cross-reference that should form the hyper-link when the hyperref package is used (see section 9). The hyper-link arguments #2 and #3 *must* appear in that order. (Leaving them out completely will not cause an error, but in that case no hyper-link will be created when hyperref is used, and there are better ways to achieve this. See sections 3 and 9.)

Note that the default format for equation cross-references already overrides \crefdefaultlabelformat in order to surround the label by brackets, so the redefining \crefdefaultlabelformat will have no effect on equations. The label format for equations must be customised separately if you want to change it (see section 6.1.2).

\crefrangeconjunction   The conjunction used in a reference range can be customised by defining \crefrangeconjunction:

$$\newcommand\{\crefrangeconjunction\}\{\langle conjunction\rangle\}$$

It does not have to be an actual conjunction in the linguistic sense, e.g. it is perfectly reasonable to define it to be an emdash "--". \crefrangeconjunction is used directly between the start and end references in a reference range, without any additional space surrounding it, e.g. \crefrange{thm1}{thm2} is type-set as

```
theorems~\ref{thm1}\crefrangeconjunction\ref{thm2}
```

so you may or may not want to include surrounding space, depending on the formatting you desire. For example,

```
\newcommand{\crefrangeconjunction}{ and~}
```

does require surrounding space, whereas

```
\newcommand{\crefrangeconjunction}{--}
```

does not.

\crefrangepreconjunction   There are two other "conjunction" commands available for customizing
\crefrangepostconjunction   the formatn for reference ranges. These are \crefrangepreconjunction and \crefrangepostconjunction, which insert text before the first label defining the range, and after the second label, respectively. For example, when these commands are defined, \crefrange{thm1}{thm2} is type-set as

```
theorems~\crefrangepreconjunction\ref{thm1}
 ➥ \crefrangeconjunction\ref{thm2}\crefrangepostconjunction▮
```

These commands are not used in the default English format definitions, but they are needed in some languages to correctly express a range. For example, the Italian format defines \crefrangepreconjunction to be "da", so that \crefrange{thm1}{thm2} produces

```
teorema da~\ref{thm1} a~\ref{thm2}
```

\crefpairconjunction
\crefmiddleconjunction
\creflastconjunction

The conjunctions used in lists of multiple cross-references can be customised by defining the commands \crefpairconjunction, \crefmiddleconjunction and \creflastconjunction:

```
\newcommand{\crefpairconjunction}{⟨conjunction⟩}
\newcommand{\crefmiddleconjunction}{⟨conjunction⟩}
\newcommand{\creflastconjunction}{⟨conjunction⟩}
```

\crefpairconjunction is used when there are only two cross-references in the list, \creflastconjunction is used between the penultimate and final cross-reference in a list of more than two, and \crefmiddleconjunction is used between all the others. Again, they do not have to be conjunctions in the linguistic sense, and the same considerations about surrounding space apply as in the case of \crefrangeconjunction. For example, the default definition of \crefmiddleconjunction is:

```
\newcommand{\crefmiddleconjunction}{, }
```

\crefpairgroupconjunction
\crefmiddlegroupconjunction▮
\creflastgroupconjunction

By default, the conjunctions used to separate sub-lists of different cross-reference types in a multi-reference are identical to those used to separate cross-references of the same type[6]. You can override this by defining the conjunction commands \crefpairgroupconjunction, \crefmiddlegroupconjunction and \creflastgroupconjunction.

For example,

```
\cref{eq1,eq2,eq3,thm1,thm2,fig1,thm3}
```

is type-set as

```
eqs. (1)\crefrangeconjunction(3)\crefmiddlegroupconjunction
theorems 1\crefpairconjunction2\crefmiddlegroupconjunction
fig. 1\creflastgroupconjunction{}theorem 3
```

6.1.2 Customising Individual Cross-Reference Types

\crefname
\Crefname

The cross-reference name for a given cross-reference type is customised using the \crefname and \Crefname commands:

---

[6]More accurately, if you redefine \crefpairconjunction etc. in your preamble, \crefpairgroupconjunction etc. are automatically redefined so that they match. (In some languages, the default definition of \creflastgroupconjunction has an additional comma lacking in \creflastconjunction.)

$$\verb|\crefname{|\langle type\rangle\verb|}{|\langle singular\rangle\verb|}{|\langle plural\rangle\verb|}|$$
$$\verb|\Crefname{|\langle type\rangle\verb|}{|\langle singular\rangle\verb|}{|\langle plural\rangle\verb|}|$$

used by the `\cref` and `\Cref` commands, respectively. You must supply both ⟨*singular*⟩ and ⟨*plural*⟩ forms of the name. If the corresponding `\Crefname` is undefined when `\crefname` is called, it will automatically define `\Crefname` to be a capitalised version of `\crefname`, using `\MakeUppercase`. Conversely, if the corresponding `\crefname` is undefined when `\Crefname` is called, it will automatically define `\crefname` to be a lower-case version of `\Crefname`, using `\MakeLowercase`. Obviously, this will only work properly if the names begin with a letter. If the first letter is a special character construct, such as an accented character, you will need to surround it by braces. If the first thing in the name is *not* a letter at all (e.g. if it is a LATEX command), you *must* define both capitalisation variants explicitly. Otherwise you will get strange and fatal errors when processing the document.

The cross-reference ⟨*type*⟩ is usually the name of the counter for the environment (equation, chapter, section, etc.). The exceptions are appendices, labels whose type has been overridden explicitly by supplying an optional argument (see section 7), and theorem-like environments when the `ntheorem` package is loaded, for which ⟨*type*⟩ should instead be the environment name (lemma, corollary, definition, etc.) even when different environments are part of the same numbering sequence. (`ntheorem` provides extra information about the environment when different theorem-like environments share a common counter, which `cleveref` makes use of to distinguish between them automatically.) In the case of appendices, the ⟨*type*⟩ is "appendix" for the top-level sectioning command (`\chapter` or `\section`, depending on the document class), "subappendix" for the sectioning command one level below (`\section` or `\subsection`), "subsubappendix" for the next level of sectioning command, etc.

For convenience, if they have not been otherwise customised by the end of the preamble, the cross-reference name (and label format) for `subsection` is by default inherited from that of `section`, and that of `subsubsection` is inherited from `subsection` (which might itself have been inherited from `section`). Similarly for `subappendix`, `subsubappendix` and `subsubsubappendix`, and also for `enumii`, `enumiii`, `enumiv` and `enumv`. Finally, `subfigure` and `subtable` inherit from `figure` and `table`, respectively.

`\creflabelformat`   You may want the label format for a particular cross-reference type to differ from the global format set by `\crefdefaultlabelformat` (see section 6.1.1). You can do this using

$$\verb|\creflabelformat{|\langle type\rangle\verb|}{|\langle format\rangle\verb|}|$$

The ⟨*type*⟩ argument is the cross-reference type to customise, and the ⟨*format*⟩ argument defines the label format for cross-references of that type. As in the case of `\crefdefaultlabelformat`, the latter should contain the three arguments `#1`, `#2` and `#3`, the first being the formatted version of the label counter, the others determining the beginning and end of the portion that becomes a hyper-link when the `hyperref` package is loaded (see section 9). `#2` and `#3` *must* appear in that order.

\crefrangelabelformat Normally, the start and end references in a reference range are type-set using the usual label format (as defined by `\crefdefaultlabelformat` or `\creflabelformat`) separated by `\crefrangeconjunction` (section 6.1.1). You can override this for a given cross-reference type using

> `\crefrangelabelformat{⟨type⟩}{⟨format⟩}`

The ⟨*format*⟩ argument should contain six arguments: `#1`, `#2`, `#3`, `#4`, `#5`, `#6`. The first two (`#1` and `#2`) are the formatted versions of the two label counters defining the reference range. The next two (`#3` and `#4`) denote the beginning and end of the hyper-link for the first reference, the final two (`#5` and `#6`) the hyper-link for the second reference. The hyper-link arguments *must* appear in order. For example,

> `\crefrangelabelformat{equation}{(#3#1#4) to~(#5#2#6)}`

6.2   Low-Level Customisation: Taking Full Control

If you need more precise control over the cross-reference format than is possible by customising the individual components, then you can take full control of the format for any given type, overriding the component-derived format entirely. The formats for single cross-references, reference ranges and multi-references are customised separately. If you only customise some of these, the other formats will be constructed from components, as usual.

Note that when deciding which cross-references should be grouped together for sorting and/or compressing, `cleveref` does something slightly more complicated than simply checking whether the reference types match. In fact, it checks whether the reference *formats* match[7]. This will always be the case for cross-references of the same type. But it could also be the case for cross-references that have different types, if the cross-reference formats happen to be identical.

The reason for doing this is to allow cross-references to e.g. sections and subsections to be grouped together if they have identical formats. The default formats for the sectioning commands, figures and subfigures, tables and subtables, and enumerated lists are set up in this way. If you change any of them using the low-level customisation commands, but still want them to be grouped together, then you must ensure that the formats are *identical*. (It is *not* sufficient for the formats to produce identical type-set text; the format definitions must contain identical LaTeX code.)

6.2.1   Single Cross-References

\crefformat   Cross-reference formats for *single* cross-references are defined or redefined using
\Crefformat   the
`\crefformat` and `\Crefformat` commands, which are used by the `\cref` and `\Cref` commands respectively. These take two arguments: the cross-reference type, and the formatting code:

---

[7]To be precise, `cleveref` checks whether the `\crefformat`'s match.

```
\crefformat{⟨type⟩}{⟨format⟩}
\Crefformat{⟨type⟩}{⟨format⟩}
```

The ⟨type⟩ is usually the name of the counter, except for labels whose type has been overridden explicitly (see section 7), theorem-like environments when `ntheorem` is loaded, in which case it is the environment name, and appendices. For the latter, the ⟨type⟩ is "appendix" for the top-level sectioning command (`\chapter` or `\section`, depending on the document class), "subappendix" for the sectioning command one level below (`\section` or `\ubsection`), "subsubappendix" for the next level of sectioning command, etc.

As in the case of the `\crefname` and `\Crefname` commands, if the corresponding `\Crefformat` is undefined when `\crefformat` is called, it will define the `\Crefformat` to produce a capitalised version of `\crefformat`, using `\MakeUppercase`. Conversely, if the corresponding `\crefformat` is undefined whe `\Crefformat` is called, it will define the `\crefformat` to produce a lower-case version of `\Crefformat`, using `\MakeLowercase`. Obviously, this will only work properly if the format starts with a letter, and letter constructs (such as accented letter constructs) must be surrounded by braces (see section 6.1.1).

The ⟨format⟩ argument can be any valid LaTeX code, though you will need to `\protect` fragile commands. It should contain three arguments, `#1`, `#2` and `#3`. The first argument is the formatted version of the label counter (e.g. `\theequation`). The other two are used to mark the beginning and end of the part of the cross-reference that forms the hyper-link when the `hyperref` package is used, and *must* appear in that order (see section 9).

As an example,

```
\crefformat{equation}{Eq.~(#2#1#3)}
```

will type-set equation references as

Eq. (⟨counter⟩)

with the counter (excluding the brackets) forming the hyper-link.

Note that the hyper-link arguments are *not* letters, so if `#2` appears at the beginning of ⟨format⟩, `cleveref` will not be able to automatically define the other capitalisation variant automatically using `\MakeUppercase` or `\MakeLowercase`. In this case, you will have to define both variants separately. For example, if you wanted to the "Eq." to be part of the hyper-link, you would have to define:

```
\crefformat{equation}{#2eq.~(#1)#3}
\Crefformat{equation}{#2Eq.~(#1)#3}
```

6.2.2   Reference Ranges

\crefrangeformat The format for reference ranges is defined by `\crefrangeformat` and
\Crefrangeformat `\Crefrangeformat`. Like `\creformat` and `\Crefformat`, the commands take two arguments: the cross-reference type, and the formatting code.

```

```
\crefrangeformat{⟨type⟩}{⟨format⟩}
\Crefrangeformat{⟨type⟩}{⟨format⟩}
```

The same comments apply as in the case of single cross-references: the ⟨*type*⟩ is usually the name of the counter, except for appendices, labels with explicitly overridden types, and theorem-like environments when `ntheorem` is loaded. Again, if the other-capitalisation variant is not already defined, it will be defined automatically.

The ⟨*format*⟩ argument can again be any valid LATEX code, with fragile commands `\protect`ed. However, this time it should contain *six* arguments, #1–#6. The first two (#1 and #2) are the formatted versions of the label counters, the next two (#3 and #4) are used to mark the beginning and end of the hyper-link for the first cross-reference, and the final two (#5 and #6) mark the beginning and end of the second cross-reference's hyper-link.

As an example,

```
\crefrangeformat{equation}{eqs.~(#3#1#4) to~(#5#2#6)}
```

would type-set equation reference ranges as

eqs. (⟨*counter1*⟩) to (⟨*counter2*⟩)

with the counters (excluding the brackets) forming the hyper-links.

6.2.3 Multiple Cross-References

\crefmultiformat
\Crefmultiformat
\crefrangemultiformat
\Crefrangemultiformat

The format for multiple cross-references is defined by `\crefmultiformat` and `\Crefmultiformat`, and that of reference ranges within multiple cross-references by `\crefrangemultiformat` and `\Crefrangemultiformat`. Multi-references also require *all* the other cross-reference formats to be defined (see sections 6.2.1 and 6.2.2), including the single reference range formats, even if you never use the `\crefrange` and `\Crefrange` commands.

The commands all take five arguments: the cross-reference type, the format for the first cross-reference in a list, the format for the second cross-reference in a list of two, the format for the middle cross-references in a list of more than two, and the format for the last cross-reference in a list of more than two.

```
\crefmultiformat{⟨type⟩}{⟨first⟩}{⟨second⟩}{⟨middle⟩}{⟨last⟩}
\Crefmultiformat{⟨type⟩}{⟨first⟩}{⟨second⟩}{⟨middle⟩}{⟨last⟩}
\crefrangemultiformat{⟨type⟩}{⟨first⟩}{⟨second⟩}{⟨middle⟩}{⟨last⟩}█
\Crefrangemultiformat{⟨type⟩}{⟨first⟩}{⟨second⟩}{⟨middle⟩}{⟨last⟩}█
```

The ⟨*type*⟩ is, as ever, the counter name, except for appendices, explicitly overridden label types, and theorem-like environments then the `ntheorem` package is loaded. The same considerations apply to the formatting arguments ⟨*first*⟩, ⟨*second*⟩, ⟨*middle*⟩ and ⟨*last*⟩ as for the ⟨*format*⟩ argument of `\crefformat` or `\crefrangeformat`, including the meaning of the arguments that should appear in the formatting code (#1, #2 and #3 for `\crefmultiformat` and

`\Crefmultiformat`, #1–#6 for `\crefmultiformat` and `\Crefmultiformat`). However, when the corresponding other-capitalisation variant is automatically defined, only the first letter of the ⟨*first*⟩ argument is upper- or lower-cased; the other arguments are defined to be identical for both variants.

Be careful to get the spaces at the beginning and end of the formatting code correct: the ⟨*first*⟩ and ⟨*second*⟩, or ⟨*first*⟩, ⟨*middle*⟩ and ⟨*last*⟩, LaTeX code is typeset one after another in a multi-reference, with no space separating them. You may or may not want spaces at the beginning and end of the formatting code, depending on the formatting you desire. For example, in the default equation format:

```
\crefmultiformat{equation}{eqs.~(#2#1#3)}%
    { and~(#2#1#3)}{, (#2#1#3)}{ and~(#2#1#3)}
```

the ⟨*middle*⟩ argument should *not* have a space at the beginning, whereas the ⟨*second*⟩ and ⟨*last*⟩ arguments *should* have a space.

6.3   Language and `babel` support

`cleveref` supports different languages via package options, in the usual way, though not all languages are supported yet[8]. The `babel` package is also supported when it is loaded, allowing you to change language using the `babel` language switching commands such as `\selectlanguage` and `\foreignlanguage`.

The `babel` support works by redefining the cross-reference names and conjunctions for the default cross-reference types. Any customisations you make to the default cross-reference names and conjunctions *in the preamble* apply to the main language (i.e. the last language listed in the options). A `\selectlanguage` command or similar will override these customisations, replacing them with the defaults for the new language. If you later use `\selectlanguage` to switch back to the main language, your customisations will be restored. If you want to customise cross-reference names or conjunctions for any language other than the main one, you either have to explicitly redefine them after every language switching command, or hook the redefinitions into `babel`'s language switching mechanism. (See section 11.11 and the `babel` documentation.)

If you have defined formats for new cross-reference types for which no defaults are provided, then you're on your own. `cleveref` will not know how to redefine them for other languages, and again you will have to take care of it yourself, either by explicitly redefining them in your document after each language switch, or by hooking the redefinitions into `babel`'s language switching mechanism.

On the other hand, since the language switching commands only modify the cross-reference components, if you use the low-level customisation commands to take full control of the format for a particular cross-reference type, then (unless you're careful) you take it out of the control of `babel` entirely. If you want to use the low-level customisation commands, but *do* still want

---

[8]Currently, only `english`, `german`, `ngerman`, `french`, `spanish` and `italian` are supported. Contributions of translations for missing languages are very welcome! See section 11.11 for information on how to contribute translations.

the language switching commands to work, then you have to use the component macros in your customised formats. The cross-reference names are stored in macros called `\cref@`*⟨type⟩*`@name`, `\Cref@`*⟨type⟩*`@name`, `\cref@`*⟨type⟩*`@name@plural`, and `\Cref@`*⟨type⟩*`@name@plural`. (Note that since these macro names contain the "@" character, you must use `\makeatletter` and `\makeatother` to access them.)

For example, if you wanted to redefine the equation format so that the cross-reference name ("equation") was also part of the hyper-link, but you still want to be able to switch language using `babel`, you would need something like:

```
\makeatletter
\crefformat{equation}{#2\cref@equation@name~(#1)#3}
...
\makeatother
```

and similarly for `\crefrangeformat`, `\crefmultiformat`, `\Crefformat`, etc.

7 Overriding the Cross-Reference Type

`\label` As described previously, a label's "type" is usually determined by its counter, or in the case of `ntheorem` theorem-like environments by the environment name. Occasionally, you may want to override the cross-reference type for a particular label. You can do this by supplying the desired type as an optional argument to the `\label` command:

> `\label[`*⟨type⟩*`]{`*⟨label⟩*`}`

One circumstance in which is useful is when you want to define a special cross-reference format for certain labels of a given type. By supplying a type that doesn't already exist as the optional argument to `\label`, you can then define the cross-reference format for that new type in whatever way you like, without affecting other cross-references of the same type. For example, if a particular equation contains multiple expressions and you want it to always be referred to in the plural, you could use:

```
\crefname{pluralequation}{eqs.}{eqs.}
...
\label[pluralequation]{eq1}
```

You can of course reuse this format for other plural equations, too.

If you need to do this frequently, it can become tedious specifying the label explicitly each time. An alternative is to use the `aliascnt` package. This lets you define one counter to be an alias for another, so that effectively the same counter has two names. Since `cleveref` determines the label type from the counter name, the two counter aliases can have different cross-reference formats whilst really being the same counter. You have to somehow arrange for the correct counter alias to be used depending on which cross-reference format you want (probably

by defining two variants of the environment in question). But the effort involved might be worth the convenience of not having to remember to pass an explicit optional argument to a large number of labels.

You can use this trick to get different cross-reference formats for different theorem-like environments, *without* using the `ntheorem` package[9]. For example,

```
\usepackage{aliascnt}
\usepackage{cleveref}
\newaliascnt{lemma}{theorem}
\newtheorem{lemma}[lemma]{Lemma}
\aliascntresetthe{lemma}
\crefname{lemma}{lemma}{lemmas}
```

8   Poor Man's `cleveref`

Sometimes you may need to send your LaTeX source to someone who can't or won't install the `cleveref` package themselves. For example, many academic journals accept papers in LaTeX format, but only support a small subset of the packages available on CTAN. The `poorman` option was designed specifically to help in this situation.

When the `poorman` option is supplied, your document will be processed as normal. But in addition, a `sed` script will automatically be written, containing rules for replacing all the `\cref` commands with the LaTeX code that they would produce, and using the standard `\ref` command to produce the cross-references themselves. I.e. the script rewrites your document as you would have done if you had had to do it manually!

The advantage, of course, is that you *don't* have to do it manually. Instead, you can use all the features of `cleveref`, and once you've created a version of your document that you want to send elsewere, you can process it through the `sed` script to completely remove the `cleveref` dependency. The recipient won't even realise you used `cleveref`!

The `sed` script is written to the same directory as the (main) LaTeX source file, and given the same name as that source file but with the extension `.sed`. To process your document through the script, all you need to do is run the following from your shell:

sed -f ⟨*name*⟩`.sed` ⟨*name*⟩`.tex` >⟨*newname*⟩`.tex`

where ⟨*name*⟩ is the name of the file containing your LaTeX source file minus the `.tex` extension, and ⟨*newname*⟩ is whatever you want to call the new version. *Do not* make ⟨*newname*⟩ the same as ⟨*name*⟩: it won't work. (It's in any case wise to keep the original LaTeX source file containing the `cleveref` commands, in case you need to produce an updated version of your document in the future. Think of

---

[9]This trick seems to belong to LaTeX mythology, and certainly isn't my own idea! But I haven't been able to definitively track down who originally came up with it.

the ⟨*newname*⟩.tex file in the same way as a DVI file: something you can always reproduce from the original source.)

If your document is composed of a number of separate LaTeX source files, combined with \include commands, only one sed script will be generated, but you will need to run *each* source file through that *same* script (and probably modify the \include commands to match the new file names). However, using babel's language switching commands in a document split across multiple separate source files is beyond the capabilities of the poorman option. You will almost certainly need to manually tweak the sed script in that case.

Note that the poorman script cannot fully reproduce the type-setting of the original cleveref cross-references in all cases[10]. In particular, any customisation of hyper-links will be lost, and if you're using varioref with the legacyvarioref option (see section 9, the spacing before the \vref command will not be correct.

9 Interaction with Other Packages

The cleveref package *must* be loaded *after* all other packages that don't specifically support it[11], i.e. the

    \usepackage{cleveref}

line should always be the last \usepackage command in your document's preamble.

Since cleveref redefines many internal commands involved in LaTeX's cross-referencing system, it can interact badly with other packages that do the same. The fancyref package, ntheorem's thref option, and varioref's \labelformat command, are incompatible with cleveref. (Note that varioref *is* fully supported by cleveref, just that cleveref's features supersede varioref's \labelformat feature.) However, since cleveref implements a significantly enhanced version of these packages' features, this is not really a problem.

\thref   In fact, if ntheorem is loaded with the thref option, cleveref redefines
\vref   ntheorem's \thref command for you, to be an alias for \cref. Similarly, if
\Vref   varioref is loaded, cleveref redefines the \vref, \vrefrange, \fullref com-
\vrefrange   mands and variants to instead use the cleveref features for cross-reference
\Vrefrange   formatting, whilst retaining all the varioref page-referencing magic. You
\fullref   can continue to use the other varioref and ntheorem commands (other than
\Fullref   \labelformat and the thref option) whilst using cleveref, as long as cleveref
is loaded *last*.

\vref*   Note that, whilst in the business of redefining the varioref commands,
\Vref*   cleveref seizes the opportunity to get rid of the irritating spacing behaviour
\vrefrange*   of the \vref and \Vref commands, instead making it consistent with the other
\Vrefrange*   cleveref cross-referencing commands. This also frees up the starred variants to
\fullref*   be used to suppress hyper-links when the hyperref package is loaded, as usual.
\Fullref*

---

[10] At least, not without resorting to inserting low-level LaTeX code in your document, which would somewhat defeat the purpose of the poorman option.

[11] At the time of writing, I'm not aware of any that do.

(Unfortunately, due to lack of support for this in `varioref`, the page references will still be hyper-links, even when using the starred variants. Go bug the `varioref` maintainer about this if you don't like it.)

legacyvarioref However, the `cleveref` redefinitions break strict compatibility with the original `varioref` commands. If you need the original spacing behaviour for compatibility reasons, pass the `legacyvarioref` option to `cleveref`. If this option is supplied, only the original `varioref` commands `\vref`, `\vref*`, `\vrefrange` and `\fullref` will be provided, not any of the additional variants, and the starred variants will change the spacing around the commands as per the original `varioref` implementation, rather than supressing hyper-links.

Other packages which alter the LaTeX referencing system are unlikely to work properly with `cleveref`. (For example, although `cleveref` fully supports the `hyperref` package's hyper-link features, the `backref` option is not currently supported. Similarly, `cleveref` is currently incompatible with the `memoir` class, though some versions are reported to partially work.) See section 10 for additional information.

10 Known Bugs and Possible Improvements

10.1 Known Bugs, Non-Bugs, and Work-Arounds

In no particular order:

- When both the `amsmath` *and* `hyperref` packages are loaded at the same time, the `cleveref` cross-referencing commands do not work when used within section titles. If anyone can figure out why, let me know! As a work-around, use `\ref` within section titles when your document uses both `amsmath` and `hyperref`.

- `cleveref` will not work properly with the standard LaTeX `eqnarray` environment. There is no intention to fix this. The `eqnarray` environment is poorly implemented, making it difficult to get it to work properly with `cleveref`. You're better off using the `amsmath` replacements in any case, such as `gather`, `align`, `multline` and `split`, which *do* work properly with `cleveref`. (See http://www.tug.org/pracjourn/2006-4/madsen/).

- `cleveref` currently only provides language support for English, German, French, Spanish and Italian. Please contribute translations for missing languages![12]

- `cleveref` can't cope with active characters being present in cross-reference label names. For example, if French `babel` support is loaded, the commonly used ":" in label names will often fail, spewing the usual random selection of mysterious TeX errors that accompany such deep-seated errors. The solution is to avoid using active characters in label names. (You may need to consult

---

[12]See section 11.11 for information on how to contribute translations.

e.g. the `babel` documentation to discover which active characters are defined in your language.)

- `cleveref` assumes that counters are only ever reset by the standard sectioning commands (`\chapter`, `\section`, etc.). If this is not the case, the automatic compression of consecutive cross-references into a reference range may be incorrect. Making this more flexible would be a simple task, but so far there doesn't seem to be much need for it.

- `cleveref` breaks `hyperref`'s `backref` option, and probably also the `backref` package when used as a stand-alone package. (This should be fixed in a future version.)

- `cleveref` is almost certainly incompatible with `titleref`, `byname`, `nameref` and the like. This shouldn't be difficult to fix, and if you want this feature, then... patches are always welcome! (Note that `cleveref` *is* compatible with `hyperref`, despite that fact that this loads `nameref` automatically. It's just that the `nameref` features won't work.)

- Given all the above, it's not surprising that `cleveref` is incompatible with the `memoir` class, which incorporates many of the above packages. There are some reports of some versions of `cleveref` partially working with `memoir`, but this should not be considered reliable. Compatibility with `memoir` will become a realistic possibility once compatibility with the other packages (listed above) is added.

- `cleveref` doesn't know about the `subfloat` package, so you have to revert to using `\ref` for cross-references to sub-figures. (This should be fixed in a future version.)

- The `poorman` `sed` script loses any custom `cleveref` hyper-link formatting you might have defined, and does not reproduce the original spacing around the `\vref` command when `varioref` is used with the `legacyvarioref` option. This is not a bug; it is a side-effect of the intended purpose of the `poorman` option. The philosophy behind `poorman` is to replace `cleveref`'s enhanced cross-referencing with standard LaTeX cross-reference commands that are guaranteed to work with any standard LaTeX installation. Although it would be simple to fix these "bugs", it's almost certainly impossible without using low-level LaTeX code that is unlikely to be supported by journals, thereby defeating the whole purpose of the `poorman` option.

10.2 Possible Improvements

In no particular order:

- The `poorman` option could be enhanced to allow a choice of scripting language rather than just `sed` (e.g. `awk`, `perl`, ... ?), but these are unlikely to be much better for those apt to complain about the use of `sed`. The portable option

would be to output a TeX "script", but this would be *much* more work[13] than I'm prepared to invest.

11 Implementation

Essentially, the core of the implementation consists of causing an extra piece of information – the label "type" – to be written to the aux file, and defining \cref commands which use this extra information to type-set the reference.

The least invasive implementation of this kind of thing seems to be that used by the varioref package. Namely, to redefine the \refstepcounter command so that the \@currentlabel macro, which usually just contains the type-set version of the counter, now contains the additional type information. (In fact, we write three extra pieces of information: the type, the counter value itself, and the value of the counter that causes the label's counter to be reset, which we call the "prefix" from now on.) \@currentlabel eventually gets written to the aux file as an argument to \newlabel by the usual LaTeX mechanisms. This involves less hacking to get everything else working again, since very few macros other than \ref rely on this particular \newlabel argument (nor are other packages likely to, given that varioref plays around with it and is a required LaTeX package).

11.1 Redefinitions of LaTeX kernel macros

\refstepcounter
\@currentlabel
\cref@old@refstepcounter

We store the original \refstepcounter in \cref@old@refstepcounter, then re-define \refstepcounter so that it first calls the old version before adding the extra information to \@currentlabel. The new \@refstepcounter can take an optional argument, which overrides the default "type" inferred from the counter.

```
1 \let\cref@old@refstepcounter\refstepcounter
2 \def\refstepcounter{%
3   \@ifnextchar[{\refstepcounter@optarg}{\refstepcounter@noarg}%]
4 }
5 \def\refstepcounter@noarg#1{%
6   \cref@old@refstepcounter{#1}%
7   \cref@constructprefix{#1}{\@result}%
8   \protected@edef\@currentlabel{%
9     [#1][\arabic{#1}][\@result]%
10    \csname p@#1\endcsname\csname the#1\endcsname}}
11 \def\refstepcounter@optarg[#1]#2{%
12   \cref@old@refstepcounter{#2}%
13   \cref@constructprefix{#2}{\@result}%
14   \protected@edef\@currentlabel{%
15     [#1][\arabic{#2}][\@result]\@currentlabel}}
```

\label
\cref@override@label@type

We redefine the \label command to allow it to take an optional argument that overrides the default reference type in \@currentlabel. We have to postpone this redefinition of \label until the beginning of the document because some other packages do too, and we need to override their redefinitions. \cref@override@label@type is a convenience macro for overriding the label type stored in \@currentlabel.

```
16 \def\cref@override@label@type[#1][#2][#3]#4\@nil#5{[#5][#2][#3]#4}
17 \AtBeginDocument{%
```

21

```
18    \let\cref@old@label\label
19    \def\label{\@ifnextchar[\label@optarg\cref@old@label}%]
20    \def\label@optarg[#1]{%
21      \protected@edef\@currentlabel{%
22        \expandafter\cref@override@label@type\@currentlabel\@nil{#1}}%
23      \cref@old@label}%
```

The amsmath package redefines the \label command within equation environments, so if it is loaded we have to extend the behaviour to support the optional argument. With amsmath, the original \label command is stored in \ltx@label, and \label@in@display replaces \abel inside equations. \label@in@display just saves the label for later, and defining it is left until the end of the equation, when \ltx@label is finally called.

To allow \label within equations to support an optional argument, we first store the original \label@in@display and the new \label macro we defined above (since \label will be clobbered inside equations). Then we redefine \abel@in@display so that it wraps all its arguments, including any optional argument, in an extra set of braces. These are stripped away again by \ltx@label before calling the \label macro we defined above (saved in \cref@label).

```
24    \@ifpackageloaded{amsmath}{%
25      \let\cref@label\label
26      \let\cref@old@label@in@display\label@in@display
27      \def\label@in@display{%
28        \@ifnextchar[\label@in@display@optarg\label@in@display@noarg}%]
29      \def\label@in@display@noarg#1{\cref@old@label@in@display{{#1}}}
30      \def\label@in@display@optarg[#1]#2{%
31        \cref@old@label@in@display{[#1]{#2}}}
32      \def\ltx@label#1{\cref@label#1}
33      \let\cref@old@make@df@tag@@\make@df@tag@@
```

In order for subequations to be sorted properly, cleveref needs to know that the equation counter is effectively reset by the parentequation counter within the subequations environment. This isn't how amsmath implements subequations (for obvious reasons!), but we harmlessly add the equation counter to the parentequation counter's reset list *within* subequations environments, so that cleveref's sorting mechanism can figure things out. We also harmlessly make sure parentequation is reset by the same counter as equation.

```
34    \let\cref@old@subequations\subequations%
35    \let\cref@old@endsubequations\endsubequations%
36    \cref@resetby{equation}{\@result}%
37    \ifx\@result\relax\else%
38      \@addtoreset{parentequation}{\@result}%
39    \fi%
40    \renewenvironment{subequations}{%
41      \@addtoreset{equation}{parentequation}%
42      \cref@old@subequations%
```

```
43   }{%
44     \gdef\cl@parentequation{}%
45     \cref@old@endsubequations%
46     \setcounter{parentequation}{0}%
47   }%
```

\make@df@tag@@
\make@df@tag@@@   We override the internals of the `amsmath` \tag command to add the additional information to the label definition.

```
48     \def\make@df@tag@@#1{%
49       \gdef\df@tag{\maketag@@@{#1}%
50         \def\@currentlabel{[equation][][]#1}}}
51     \def\make@df@tag@@@#1{%
52       \gdef\df@tag{\tagform@{#1}%
53         \toks@\@xp{\p@equation{#1}}%
54           \edef\@currentlabel{[equation][][]\the\toks@}}}
55   }{}%
56 }
```

\ref   The standard \ref macro spits out whatever was in \@currentlabel when the label was written to the aux file, but this now contains additional information which we don't want. Therefore, we redefine \ref to recover the original behaviour. We have to defer redefinition of \ref till the beginning of the document, in case other packages (such as ntheorem) modify it after cleveref is loaded. The apparently pointless \cref@reflabel adds a leyer of indirection to make it easier in case we need to redefine it for hyperref later.

```
57 \def\cref@reflabel#1#2{\@result}
58 \AtBeginDocument{%
59   \DeclareRobustCommand{\ref}{\cref@ref}
60   \def\cref@ref#1{%
61     \expandafter\ifx\csname r@#1\endcsname\relax%
62       \let\@result\relax%
63     \else%
64       \cref@getlabel{#1}{\@result}%
65     \fi%
66     \expandafter\@setref\csname r@#1\endcsname{\cref@reflabel}{#1}}%
67 }
```

\appendix
\cref@old@appendix   The \appendix command causes the top-level sectioning commands (\chapter or \section, depending on the document class) to produce appendices instead. Since we want to be able to format references to appendices separately from references to normal top-level sections, we add to the tasks that \appendix does: it redefines \refstepcounter@noarg to exceptionally override the label type for chapters or sections, as appropriate, setting it to "appendix" instead. There are two alternative definitions: one if "section" is the top-level sectioning command, and one if "chapter" fulfils that role.

```
68 \let\cref@old@appendix\appendix
69 \renewcommand\appendix{%
70   \cref@old@appendix%
```

```
71    \@ifundefined{chapter}{%
72      \gdef\refstepcounter@noarg##1{%
73        \cref@old@refstepcounter{##1}%
74        \cref@constructprefix{##1}{\@result}%
```

We add a large value to the front of the counter data, to force references to anything in appendices to be sorted after everything else.

```
75        \edef\@result{{2147483647}\@result}%
```

Override the cross-reference type of sectioning commands.

```
76        \def\@tmpa{##1}%
77        \def\@tmpb{section}%
78        \ifx\@tmpa\@tmpb%
79          \protected@edef\@currentlabel{%
80            [appendix][\arabic{##1}][\@result]\@currentlabel}%
81        \else%
82          \def\@tmpa{##1}%
83          \def\@tmpb{subsection}%
84          \ifx\@tmpa\@tmpb%
85            \protected@edef\@currentlabel{%
86              [subappendix][\arabic{##1}][\@result]\@currentlabel}%
87          \else%
88            \def\@tmpa{##1}%
89            \def\@tmpb{subsubsection}%
90            \ifx\@tmpa\@tmpb%
91              \protected@edef\@currentlabel{%
92                [subsubappendix][\arabic{##1}][\@result]%
93                \@currentlabel}%
94            \else%
95              \protected@edef\@currentlabel{%
96                [##1][\arabic{##1}][\@result]\@currentlabel}%
97            \fi%
98          \fi%
99        \fi}%
100   }{%
101     \def\refstepcounter@noarg##1{%
102       \cref@old@refstepcounter{##1}%
103       \cref@constructprefix{##1}{\@result}%
```

Again, the large value added to the front of the counter data forces references to appendix items to be sorted last.

```
104       \edef\@result{{2147483647}\@result}%
```

Override the cross-reference type of sectioning commands.

11.2 Utility Macros

11.2.1 aux file information

\cref@getlabel
\cref@gettype
\cref@getcounter
\cref@getprefix

Define some utility macros for extracting label, type, and counter information from the contents of \@currentlabel, as written to the aux file and stored in \r@⟨*label*⟩ when this is re-read on the next pass. Some other packages commandeer the referencing system to write label information to the aux file for other purposes, and probably use \ref to recover it later. We still want them to work, so our utility macros must cope with the type information being absent. However, since we need them to be fully expandable in various places, and \@ifnextchar is definitely *not* fully expandable, we use the work-around of having the macros store their result in another macro, whose name is passed as the second argument. This other macro *will* then be fully expandable, and can be used e.g. inside an \edef or \csname... \endcsname.

```
139 \def\cref@getlabel#1#2{%
140   \expandafter\let\expandafter\@tmpa\csname r@#1\endcsname%
141   \expandafter\expandafter\expandafter\def%
142     \expandafter\expandafter\expandafter\@tmpa%
143     \expandafter\expandafter\expandafter{%
144       \expandafter\@firstoftwo\@tmpa}%
```

```
145    \expandafter\@cref@getlabel\@tmpa\@nil#2}%
146 \def\@cref@getlabel{\@ifnextchar[%
147    \@@cref@getlabel{\@@cref@getlabel[][][]}}
148 \def\@@cref@getlabel[#1][#2][#3]#4\@nil#5{\def#5{#4}}
149 \def\cref@gettype#1#2{%
150    \expandafter\let\expandafter\@tmpa\csname r@#1\endcsname%
151    \expandafter\expandafter\expandafter\def%
152      \expandafter\expandafter\expandafter\@tmpa%
153      \expandafter\expandafter\expandafter{%
154        \expandafter\@firstoftwo\@tmpa}%
155    \expandafter\@cref@gettype\@tmpa\@nil#2}%
156 \def\@cref@gettype{\@ifnextchar[%
157    \@@cref@gettype{\@@cref@gettype[][][]}}
158 \def\@@cref@gettype[#1][#2][#3]#4\@nil#5{\def#5{#1}}
159 \def\cref@getcounter#1#2{%
160    \expandafter\let\expandafter\@tmpa\csname r@#1\endcsname%
161    \expandafter\expandafter\expandafter\def%
162      \expandafter\expandafter\expandafter\@tmpa%
163      \expandafter\expandafter\expandafter{%

175    \expandafter\@cref@getprefix\@tmpa\@nil#2}
176 \def\@cref@getprefix{\@ifnextchar[%
177    \@@cref@getprefix{\@@cref@getprefix[][][]}}
178 \def\@@cref@getprefix[#1][#2][#3]#4\@nil#5{\def#5{#3}}
```

\cref@constructprefix The \cref@constructprefix macro constructs the prefix information stored in \@currentlabel (retrieved using \cref@getprefix). This information consists of the numerical value of each counter that's involved in resetting the label's counter, i.e. it contains the numerical values of the chapter, section, subsection...numbers that (ought to) make up the formatted label produced by \the⟨*counter*⟩. E.g. if \theequation produces "B.1.3", this utility macro will return "2,1" (the "3" corresponds to the equation number itself, which is stored separately in \@currentlabel). The first argument is the counter in question; the return value is stored in the second argument, which should be a macro name.

The real work is done by the recursive **\@cref@constructprefix** macro, which works its way upwards through the counters' reset lists until it reaches a counter that isn't reset by any other.

```
179 \def\cref@constructprefix#1#2{%
180    \cref@stack@init{\@tmpstack}%
```

26

We fully expand the first argument (the counter name) because sometimes a counter name containing a macro gets passed to us.

```
181   \edef\@tmpa{\noexpand{#1\noexpand}}%
182   \expandafter\def\expandafter\@tmpa\expandafter{\@tmpa{#2}}%
183   \expandafter\@cref@constructprefix\@tmpa%
184   \cref@stack@to@list{\@tmpstack}{\@tmpa}%
185   \expandafter\def\expandafter#2\expandafter{\@tmpa}}
186 \def\@cref@constructprefix#1#2{%
187   \cref@resetby{#1}{#2}%
188   \ifx#2\relax%
189   \else%
190     \edef\@tmpa{\the\csname c@#2\endcsname}%
191     \expandafter\cref@stack@push\expandafter{\@tmpa}{\@tmpstack}%
192     \edef\@tmpa{{#2}}%
193     \expandafter\expandafter\expandafter\@cref@constructprefix%
194       \expandafter\@tmpa\expandafter{\expandafter#2\expandafter}%
195   \fi}
```

\cref@append@toks   A basic utility macro for appending tokens to a token register.

```
196 \def\cref@append@toks#1#2{\toks0={#2}%
197   \edef\act{\noexpand#1={\the#1\the\toks0}}%
198   \act}%
```

11.2.2 Stack data structures

\cref@stack@init
\cref@stack@top
\cref@stack@pop
\cref@stack@push
\cref@stack@topandbottom
\cref@stack@add
\cref@stack@to@list

We treat multiple references, supplied as a comma-separated list to \cref or \Cref, as a stack structure. So we define some utility macros for manipulating stacks (\@nil is used as an end-of-stack delimiter).

```
199 \def\cref@stack@init#1{\def#1{\@nil}}
200 \def\cref@stack@top#1{\expandafter\@cref@stack@top#1}
201 \def\@cref@stack@top#1,#2\@nil{#1}
202 \def\cref@stack@pop#1{\expandafter\@cref@stack@pop#1#1}

252   \if@notthere\cref@stack@push{#1}{#2}\fi}
```

The `\cref@isstackempty` and `\cref@isstackfull` macros test whether a stack is empty or full, respectively, and set the corresponding conditionals `\if@cref@stackempty` and `\if@cref@stackfull`.

`\if@cref@stackempty`
`\if@cref@stackfull`
`\cref@isstackempty`
`\cref@isstackfull`

```
253 \newif\if@cref@stackempty
254 \newif\if@cref@stackfull
255 \def\cref@isstackempty#1{%
256   \def\@tmpa{\@nil}%
257   \ifx#1\@tmpa\@cref@stackemptytrue%
258   \else\@cref@stackemptyfalse\fi}
259 \def\cref@isstackfull#1{%
260   \def\@tmpa{\@nil}%
261   \ifx#1\@tmpa\@cref@stackfullfalse%
262   \else\@cref@stackfulltrue\fi}
```

`\cref@stack@sort` The `\cref@stack@sort` macro sorts a stack, using the comparison macro passed in the second argument, which we use later to sort lists of references. We use

insertion sort despite its $O(n^2)$ scaling because it's simpler to code, and because we're very unlikely to encounter lists of more than ten or so referrences, so in practice a more complicated $O(n \log n)$ sorting algorithm will very likely be slower anyway.

```
263 \def\cref@stack@sort#1#2{%
264   \begingroup%
265   \cref@stack@init{\@sortstack}%

328   \fi%
329   \@iterate}
```

11.2.3 Sorting and comparison of counters

\cref@countercmp   The \cref@countercmp macro compares two sets of counter data, as returned by
\cref@getcounter, and \chardef's its third argument to 0 if they're equal, 1 if
the first comes earlier than the second, or 2 if the first comes later than the second.
This is used later for sorting references.

```
330 \def\cref@counter@first#1#2\@nil{#1}
331 \def\cref@counter@rest#1#2\@nil{#2}
332 \def\cref@countercmp#1#2#3{%
```

```
333    \begingroup%
334    \def\@tmpa{#1}%
```

In order to ensure empty references end up in the right place when sorting lists of multiple references, we make the comparison macro sorts them before a non-empty reference.

```
335    \ifx\@tmpa\@empty%
336      \def\@result{1}%
337    \else%
338      \def\@tmpa{#2}%

404   \fi%
405   \@iterate}
```

`\if@cref@inresetlist`
`\cref@isinresetlist`
`\cref@resetby`
We need to be able to determine which counter is used to reset a given counter. Usually, resets are done by sectioning counters, and we assume that to be the case here. `\cref@isinresetlist` searches through one counter's reset list, stored in `\cl@`⟨*counter*⟩, to determine whether another counter appears there, and sets the new conditional appropriately. `\cref@reset@by` searches through all the sectioning counters' reset lists, from lowest-level (subsubsection) to highest (part), checking whether the given counter is in the list, and returns the first sectioning counter in whose list it appears. (The value is returned by defining its second argument, which should be a macro name.)

```
406 \newif\if@cref@inresetlist
407 \def\cref@isinresetlist#1#2{%
408   \begingroup%
409     \def\@counter{#1}%
```

We locally redefine `\@elt`, which appears at the head of the expansion of `\cl@`⟨*counter*⟩, so that entries in the reset list end up separated by commas, thus can be treated as a stack.

```
410        \def\@elt##1{##1,}%
411        \expandafter\ifx\csname cl@#2\endcsname\relax%

FIXME: We could easily remove the hard-coded search order in `\cref@resetby` and, say, replace it with a customisable list of counters to search in order. But so far I've yet to encounter a need for anything other than the hard-coded default.

```
435 \def\cref@resetby#1#2{%

If counter in question is `equation`, and the counter `parentequation` is defined, check if it's reset by that. The `parentequation` counter is used by `amsmath`'s `subequations` environment. Although `amsmath` doesn't implement `subequations` using counter reset lists, `cleveref`'s `amsmath` support (above) tweaks the reset lists inside `subequations` environments to hook into this mechanism. We should really only check this when `amsmath` is loaded, but checking it anyway might catch other packages that independently implement amsmath's `subequations` environment (are there any?).

11.3   Referencing Commands

\cref   Define the main referencing command \cref and the start-of-sentence variant
\Cref   \Cref, along with the reference range commands \crefrange and \Crefrange.
\crefrange
\Crefrange
```
738 \DeclareRobustCommand{\cref}[1]{\@cref{cref}{#1}}
739 \DeclareRobustCommand{\Cref}[1]{\@cref{Cref}{#1}}
740 \DeclareRobustCommand{\crefrange}[2]{\@setcrefrange{#1}{#2}{cref}{}}
741 \DeclareRobustCommand{\Crefrange}[2]{\@setcrefrange{#1}{#2}{Cref}{}}
```

\@cref To save duplicating code, the referencing macros pass an argument determining the variant to an auxilliary macro **\@cref**, which does the real work. The **\@cref** macro is the behemoth at the heart of all the clever referencing features. It deals with grouping references by type, type-setting the conjunctions between groups, choosing the right formatting macro to use for each reference, and compressing consecutive references into ranges.

```
742 \def\@cref#1#2{%

```

11.4   Reference Format Customisation Commands

11.4.1   Format Component Commands

\cref@label@types   The reference formats are usually constructed out of components defined by the user-level \crefname, \Crefname, \creflabel and \crefrangelabel commands. \cref@label@types keeps track of label types for which components have been defined, and therefore need constructing at \begindocument (see below).

FIXME: we don't check if the label type is already in the list, so some formats may needlessly be redefined identically, multiple times.

```
943 \cref@stack@init{\cref@label@types}
```

\crefdefaultlabelformat   The component customisation commands simply use the supplied arguments to
\crefname   define appropriately named macros containing the formatting components. If the
\Crefname   corresponding \Crefname or \crefname variant is not already defined, \crefname
\creflabelformat   and \Crefname define it to be a version with the first letter capitalised or lower-
\crefrangelabelformat   cased, respectively.

```
944 \newcommand{\crefdefaultlabelformat}[1]{%
945   \def\cref@default@label##1##2##3{#1}}
946 \newcommand{\crefname}[3]{%
947   \@crefname{cref}{#1}{#2}{#3}{}}
948 \newcommand{\Crefname}[3]{%
949   \@crefname{Cref}{#1}{#2}{#3}{}}
950 \newcommand{\creflabelformat}[2]{%
951   \expandafter\def\csname cref@#1@label\endcsname##1##2##3{#2}%
952   \cref@stack@add{#1}{\cref@label@types}}
953 \newcommand{\crefrangelabelformat}[2]{%
```

46

```
954    \expandafter\def\csname cref@#1@rangelabel\endcsname%
955      ##1##2##3##4##5##6{#2}%
956    \cref@stack@add{#1}{\cref@label@types}}
```

\crefname@preamble
\Crefname@preamble

The \crefname@preamble and \Crefname@preamble commands are very like the \crefname and \Crefname commands, but they tag "@preamble" onto the end of the generated macro names. They are used when defining the formats for different languages (see section 11.11).

```
957 \newcommand{\crefname@preamble}[3]{%
958   \@crefname{cref}{#1}{#2}{#3}{@preamble}}
959 \newcommand{\Crefname@preamble}[3]{%
960   \@crefname{Cref}{#1}{#2}{#3}{@preamble}}
```

\@crefname

The \@crefname utility macro does the real work of defining format names, by defining an appropriately named command to contain the format component, and using the additional first argument ("cref" or "Cref") to determine how to define the corresponding command with the other capitalisation. The extra fifth argument tagged onto the end of the generated macro names.

```
961 \def\@crefname#1#2#3#4#5{%
962   \begingroup%
963     \expandafter\gdef\csname #1@#2@name#5\endcsname{#3}%
964     \expandafter\gdef\csname #1@#2@name@plural#5\endcsname{#4}%
```

The following \@tmpa macro makes use of the fact that the first character of #1 is "c" for lower-case and "C" for upper-case, in order to wrap the capitalisation-dependent parts in macros so that the rest of the code can be capitalisation-variant agnostic.

```
965   \def\@tmpa##1##2\@nil{%

11.4.2 Format Definition Commands

\crefformat   \crefformat et al. are lower-level commands that give complete control over the
\Crefformat   format of different reference types. They override the component-based formats,
\crefrangeformat   simply using the supplied arguments to define appropriately named formatting
\Crefrangeformat   macros, which are called by \@setcref. If the corresponding \Crefformat or
\crefmultiformat   \crefformat variant is not already defined, they define it to be a version with the
\Crefmultiformat   first letter capitalised or lower-cased.

\crefrangemultiformat
\Crefrangemultiformat
```
1198 \newcommand{\crefformat}[2]{\@crefformat{cref}{#1}{#2}}
1199 \newcommand{\Crefformat}[2]{\@crefformat{Cref}{#1}{#2}}
1200 \newcommand{\crefrangeformat}[2]{\@crefrangeformat{crefrange}{#1}{#2}}
1201 \newcommand{\Crefrangeformat}[2]{\@crefrangeformat{Crefrange}{#1}{#2}}
```

```
1202 \newcommand{\crefmultiformat}[5]{%
1203    \@crefmultiformat{cref}{#1}{#2}{#3}{#4}{#5}}
1204 \newcommand{\Crefmultiformat}[5]{%
1205    \@crefmultiformat{Cref}{#1}{#2}{#3}{#4}{#5}}
1206 \newcommand{\crefrangemultiformat}[5]{%
1207    \@crefrangemultiformat{crefrange}{#1}{#2}{#3}{#4}{#5}}
1208 \newcommand{\Crefrangemultiformat}[5]{%
1209    \@crefrangemultiformat{Crefrange}{#1}{#2}{#3}{#4}{#5}}
```

The utility macros do the real work, by using the first argument ("cref" or "Cref", and "crefrange" or "Crefrange") to determine how to define the corresponding command with the other capitalisation.

`\@crefformat` `\@crefformat` defines the macros for single references.

```
1210 \def\@crefformat#1#2#3{%
1211    \begingroup%
1212       \expandafter\gdef\csname #1@#2@format\endcsname##1##2##3{#3}%
```

The following `\@tmpa` macro makes use of the fact that the first character of #1 is "c" for lower-case and "C" for upper-case, in order to wrap the capitalisation-dependent parts in macros so that the rest of the code can be capitalisation-variant agnostic.

```
1213    \def\@tmpa##1##2\@nil{%

11.5 hyperref **Support**

hyperref If the hyperref package is loaded, we add hyper-link support to cleveref. Since
backref hyperref messes around with some of the same LaTeX internals as we do, we also have to override some of its redefinitions so that they work with cleveref.

```
1398 \@ifpackageloaded{hyperref}{%
1399   \PackageInfo{cleveref}{'hyperref' support loaded}
1400   \@ifpackagewith{hyperref}{backref}{%
1401     \PackageError{cleveref}{'cleveref' is currently incompatible with
1402       'hyperref's 'backref' option}{Remove the 'backref' option from
1403       'hyperref' if you want to use 'cleveref'}}{}
```

\cref@reflabel   We redefine the utility macros to cope with the extra arguments supplied by
\cref@getlabel   hyperref (via the aux file).
\cref@gettype
\cref@getcounter
\cref@getprefix
```
1404   \def\cref@reflabel#1#2#3#4#5{\@result}
1405   \def\cref@hyperref#1{\expandafter\expandafter\expandafter%
1406     \@fourthoffive\csname r@#1\endcsname}
1407   \def\cref@getlabel#1#2{%
1408     \expandafter\let\expandafter\@tmpa\csname r@#1\endcsname%
1409     \expandafter\expandafter\expandafter\def%
1410       \expandafter\expandafter\expandafter\@tmpa%
1411       \expandafter\expandafter\expandafter{%
1412         \expandafter\@firstoffive\@tmpa}%
1413     \expandafter\@cref@getlabel\@tmpa\@nil#2}
```

```
1414    \def\cref@gettype#1#2{%
1415      \expandafter\let\expandafter\@tmpa\csname r@#1\endcsname%
1416      \expandafter\expandafter\expandafter\def%
1417        \expandafter\expandafter\expandafter\@tmpa%
1418        \expandafter\expandafter\expandafter{%
1419          \expandafter\@firstoffive\@tmpa}%
1420      \expandafter\@cref@gettype\@tmpa\@nil#2}
1421    \def\cref@getcounter#1#2{%
1422      \expandafter\let\expandafter\@tmpa\csname r@#1\endcsname%
1423      \expandafter\expandafter\expandafter\def%

1434      \expandafter\@cref@getprefix\@tmpa\@nil#2}
```

\H@refstepcounter   The hyperref package stores the original \refstepcounter definition as
\H@refstepcounter, which we therefore need to modify so that it adds the extra
information to \@currentlabel.

```
1435    \def\H@refstepcounter#1{%
1436      \stepcounter{#1}%
1437      \cref@constructprefix{#1}{\@result}%
1438      \protected@edef\@currentlabel{%
1439        [#1][\arabic{#1}][\@result]%
1440        \csname p@#1\endcsname\csname the#1\endcsname}}
```

\refstepcounter@noarg   The   original   \refstepcounter,   as   stored   earlier   in
\refstepcounter@optarg   \cref@old@refstepcounter, already calls \H@refstepcounter if hyperref is
loaded, and we just redefined the latter to store the type information. So we only
need to change \@currentlabel in our \refstepcounter if an optional argument
was supplied.

```
1441    \def\refstepcounter@noarg#1{\cref@old@refstepcounter{#1}}
1442    \def\refstepcounter@optarg[#1]#2{%
1443      \cref@old@refstepcounter{#2}%
1444      \expandafter\@cref@getlabel\@currentlabel\@nil{\@tmplabel}%
1445      \cref@constructprefix{#2}{\@tmpreset}%
1446      \protected@edef\@currentlabel{%
1447        [#1][\arabic{#2}][\@tmpreset]\@tmplabel}}
```

\appendix   We again make \appendix redefine things so that the label type for chapters or
sections is exceptionally overridden and set to "appendix" instead. But this time,
it is \H@refstepcounter that needs to be redefined.

```
1448    \renewcommand\appendix{%
```

```
1449        \cref@old@appendix%
1450        \@ifundefined{chapter}{%
1451          \def\H@refstepcounter##1{%
1452            \stepcounter{##1}%
1453            \cref@constructprefix{##1}{\@result}%
```

We add a large value to the front of the counter data, to force references to anything in appendices to be sorted after everything else.

```
1454            \edef\@result{{2147483647}\@result}%
```

Override the cross-reference type of sectioning commands.

```

11.7 varioref **Support**

varioref If **varioref** is loaded, we redefine its commands to use `\cref` instead of `\ref` to produce the reference. Since `\cref` can cope with multiple references, We extend the page referencing magic of `\vref` et al. so that they check whether they need to use `\vpagerefrange` instead of `\vpageref`.

```
1599 \@ifpackageloaded{varioref}{%
1600    \PackageInfo{cleveref}{'varioref' support loaded}
1601    \PackageInfo{cleveref}{'cleveref' supersedes 'varioref's %
1602      $\backslash$labelformat command, which will not work}
1603    \AtBeginDocument{%
1604      \def\cref@vref#1#2{%
```

Since we're modifying the `varioref` commands anyway, we also (by default) take this opportunity to get rid of the irritating spacing issues of \vref et al. However, this breaks strict compatibility with the original `varioref` spacing behaviour, so we also provide a `legacyvarioref` option to restore the spacing behaviour, in case full compatibility is required.

```

11.8 Poor Man's `cleveref`

poorman The `poorman` option causes a `sed` script to automatically be written. When the original LaTeX source file is processed through this script, it strips out all the `cleveref` commands, type-setting all the reference formatting explicitly, and using the standard `\ref` command to produce the references themselves.

```
1695 \DeclareOption{poorman}{%
1696    \PackageInfo{cleveref}{option 'poorman' loaded}
```

`\cref@poorman@text` Define global macro `\cref@poorman@text` to store the text produced by the `\cref` commands, and open an output stream for writing the script before starting to process the document body.

```
1697    \gdef\cref@poorman@text{}
1698    \AtBeginDocument{%
1699       \newwrite\@crefscript%
1700       \immediate\openout\@crefscript=\jobname.sed}
```

select@language If `babel` is loaded, we add to the `\select@language` and `\forreign@language`
forreign@language commands to make them write substitution rules to the script that replace the cross-reference name and conjunction component macros with the appropriate language-dependent names. We use `sed` line-number addresses in the rules to ensure they are only applied to the regions in which that particular language was in use.

Note that we write substitution rules for the *previous* language block when the language is changed, because we need the rules to appear in the script *after* all the cross-reference substitution rules for that language block. `\ref@inputlineno` stores the input-file line-number of the start of the previous language block.

We postpone the redefinitions until the beginning of the document not only to ensure that they don't get clobbered by other package's redefinitions, but also because we don't want the redefenitions to take effect until after `babel` has called `\selectlanguage` for the main language (remember, the substitution rules for this first language block will get written at the next language change).

Note that, since we're writing to the script file within `\AtBeginDocument` and `\AtEndDocument`, this code has to come *after* the above `\AtBeginDocument` code which opens the script file for writing, and *before* the later `\AtEndDocument` code (below) which closes it.

The `\if@cref@switched@language` flag is set when a `babel` language switching command is called. It is checked by `\cref@writelanguagerules` when writing substitution rules.

```
1701    \newif\if@cref@switched@language
1702    \@ifpackageloaded{babel}{%
```

```
1703    \AtBeginDocument{%
1704      \let\cref@old@select@language\select@language
1705      \def\select@language{%
1706        \@cref@switched@languagetrue%

```

After processing the document body, we re-read in the temporary script file, and write it out again to the final `sed` script file, escaping regexp special characters in the process. The escaping is carried out by turning the regexp special characters into active characters, and defining them to expand to their escaped form. This involves a lot of juggling of catcodes and lccodes!

Both `\DeclareOption` and `\AtEndDocument` store their arguments in token lists, so all the following TEXcode is already tokenised long before it is expanded and evaluated. Thus there is no (easy) way to change the catcodes of the characters appearing here before they are tokenised. In one way this is convenient: the catcode changes we make don't "take" until evaluated, so we can continue to use the standard TEXcharacters (\, {, } etc.) even after the lines containing the catcode commands. But in another, more significant, way, it is very inconvenient: it makes it difficult to define the regexp special characters as active characters, since it's impossible to directly create tokens with the correct char- and catcodes.

We get around this by creating the unusual charcode/catcode combinations using the `\lowercase` trick (`\lowercase` changes the charcodes of all characters in its argument to their lccodes, but *leaves* their catcodes alone). That way, the argument of `\AtEndDocument` is tokenised correctly, and when it comes to be expanded and evaluated, the `\lowercase` commands create tokens with the correct char- and catcodes.

```
1837  \AtEndDocument{%
1838    \immediate\closeout\@crefscript%
1839    \newread\@crefscript%

11.9   Sort and Compress options

sort   The sort, compress or nosort options determine whether to sort and/or compress
compress lists of multiple references (default is to do both). They work simply by setting
nosort   the \if@cref@sort and \if@cref@compress flags appropriately.

\if@cref@sort
\if@cref@compress

```
2175 \newif\if@cref@sort
2176 \newif\if@cref@compress
```

Default is to both sort and compress references.

```
2177 \@cref@sorttrue
2178 \@cref@compresstrue
```

Options override default.

```
2179 \DeclareOption{sort}{%
2180   \PackageInfo{cleveref}{sorting but not compressing references}
2181   \@cref@sorttrue
2182   \@cref@compressfalse}
2183 \DeclareOption{compress}{%
2184   \PackageInfo{cleveref}{compressing but not sorting references}
2185   \@cref@sortfalse
2186   \@cref@compresstrue}
2187 \DeclareOption{sort&compress}{%
2188   \PackageInfo{cleveref}{sorting and compressing references}
2189   \@cref@sorttrue
2190   \@cref@compresstrue}
2191 \DeclareOption{nosort}{%
2192   \PackageInfo{cleveref}{neither sorting nor compressing references}
2193   \@cref@sortfalse
2194   \@cref@compressfalse}
```

11.10   Capitalise option

capitalise   The capitalise option causes cleveref to always use the \Cref* variants for
\if@cref@capitalise type-setting cross-references, so that cross-reference names are always capitalised.

```
2195 \newif\if@cref@capitalise
```

Disabled by default.

```
2196 \@cref@capitalisefalse
```

Option overrides default.

```
2197 \DeclareOption{capitalise}{%
2198   \PackageInfo{cleveref}{always capitalise cross-reference names}
2199   \@cref@capitalisetrue}
2200 \DeclareOption{capitalize}{%
2201   \PackageInfo{cleveref}{always capitalise cross-reference names}
2202   \@cref@capitalisetrue}
```

11.11 Language and `babel` Support

Default reference formats for different languages are supported via package options, in the usual way.

Any contributions of translations for missing languages are most welcome! If you can contribute definitions for a missing language, ideally you should add them below the existing ones (using those as a model), generate a patch against the original `cleveref.dtx` file, and send the patch by email to the package author. However, if you don't know how to produce a patch, you can instead just send the translations as a plain text file.

`\crefdefaultlabelformat`
`\creflabelformat`
We first define the default label formats, which don't depend on language. We override the default format for equations, to follow the near universal convention of enclosing equation labels in brackets.

```
2203 \crefdefaultlabelformat{#2#1#3}
2204 \creflabelformat{equation}{\textup{(#2#1#3)}}
```

`\cref@addto`
Utility macro to use instead of `babel`'s flawed `\addto` (copied and modified from `varioref`).

```
2205 \def\cref@addto#1#2{%
2206   \@temptokena{#2}%
2207   \ifx#1\undefined
2208     \edef#1{\the\@temptokena}%
2209   \else
2210     \toks@\expandafter{#1}%
2211     \edef#1{\the\toks@\the\@temptokena}%
2212   \fi
2213   \@temptokena{}\toks@\@temptokena%
2214 }
2215 \@onlypreamble\cref@addto
```

Passing a language option to `cleveref` defines the cross-reference names and conjunctions as appropriate for that lanauge. We can't make the definitions straight away, since they would prevent the automatic definition of the other capitalisation variant from working if the user chooses to change a default definition in the preamble, so we postpone them until the beginning of the document. However, if each language option were to simply to define any formats that aren't already defined by the end of the preamble, the *first* language option would override all the others. Unfortunately, the convention in LATEX and `babel` is for the *last* language option to take precedence. So we instead used the `\crefname@preamble` command to save the definitions in `\cref@`⟨*type*⟩`@name@preamble` etc., and after all the language options have been processed, use the contents of these to set the default definitions for any undefined formats.

For `babel` support, we add the appropriate redefinitions to the `\extras`⟨*language*⟩ macro, which is called by `babel`'s `\selectlanguage` at al. commands. The main language (the last one listed in the options) is set up by an automatic call to `\selectlanguage` at the beginning of the document, which would clobber any redefinitions made by the user in the preamble. To avoid this,

we postpone adding the redefinitions to \extras⟨*language*⟩ until the beginning of the document. Since cleveref must always be loaded *after* babel, the redefinitions won't be added to \extras⟨*language*⟩ until *after* babel has already called \selectlanguage for the main language. Thus the redefinitions will only be in effect when \selectlanguage is called explicitly within the document. (The definitions for the main language are taken care of by the language options passed to cleveref, independently of babel.)

Note that we define both capitalisation variants explicitly throughout, rather than relying on the automatic definition of the other variant, in order to make the code produced by the poor man's sed script slightly cleaner.

english English definitions (these are used by default).

```
2216 \DeclareOption{english}{%
2217   \PackageInfo{cleveref}{loaded 'english' language definitions}
```

```

We don't want the extra comma before "und" that would be added by the default fall-back definitions in terms of the above conjunctions, so we define

\crefpairgroupconjunction explicitly. In fact, we have to define the other group conjunctions explicitly too here, in case any other language option defines them explicitly and we need to override them .

11.11.1   Default Cross-Reference Formats

Setup default English format definitions, then process options in the order they
were supplied. However, the `capitalise` option must be processed before the lan-
guage options, so that it takes effect in the default format definitions. Therefore,
we have to manually check whether it's present, and force processing of it before
the other options.

```
3109 \edef\@curroptions{\@ptionlist{\@currname.\@currext}}%
3110 \@expandtwoargs\in@{,capitalise,}{%
3111   ,\@classoptionslist,\@curroptions,}%
3112 \ifin@%
3113   \ExecuteOptions{capitalise}%
3114 \else%
3115   \@expandtwoargs\in@{,capitalize,}{%
3116     ,\@classoptionslist,\@curroptions,}%
3117   \ifin@%
